I suspect part of the reason this particular CB repeater has remained on air unlicenced is because if the RI wanted to have it turned off, he would need to climb the mountain and do the job himself. The club that established the repeater has been inactive for many years now, so there is nobody the RI can interact with. So far, the repeater's solar cells and batteries have stood up remarkably well.

Yes and its a shame that the gov only sopports his buddys and they get the fat contracts. As far as us retired people i think he is just trying to get us to leave as all that they once had is taken away by him. And even my home state of maine as poor as they are still have more true help for the older people. The only thing that keeps me here is the old lady and it is where she was born so its the best state around what a joke if she did a little research on it.

I was active on CB (27mhz) in the days before it was actually legal. I remember when they bought in (then) individual licenses – just pay the $25. Then they announce the UHF CB band and planned to phase out 27mhz for 'industrial' use (at the time a lot of hospital paging systems used 27mhz for some reason). But they moved because of interference and the govt shrugged and decided not to bother – probably have been futile anyway. Then the whole license concept was quietly dropped (only a relatively small percentage bought licenses and there were never going to be enough RIs to police it) so that went out the window as well. Now it's just the Class license for anything but repeaters and it seems that's not terribly well enforced, in part probably due to the reasons you mention. I met my wife at a CB meeting in the 27mhz era – but the club didn't survive into the 80s and I know of no CB club that has. Heck, there are probably less than 30 Ham Clubs in the entire country and many of them are, like the local 'Radio and Electronics Group' formed a few years ago, it's a mix of CB and Ham operators – which seems to work pretty well, they even rebroadcast the WIA Amateur News Broadcast on UHF Ch22 at the same time as the 2M repeater. As a consequence, quite a few CBers have moved on to ham licenses, mostly Foundation, but some have gone on to Standard and Advanced as well – IIRC they license the CB repeater and the 2M repeater – best of both worlds. Still some people on 27mhz – mostly DXers rather than everyday users – some even use legal 27mhz rigs but there's a hard core using Yaesu/Kenwood stuff from last century that still has 27mhz capability – they've cracked down on that a bit recently, but pretty much only because some were causing serious interference to other services.

I’m a little surprised that a repeater could operate that long unlicensed, but then these days Radio Inspectors are fairly few and far between and don’t seem interested in CB at all anymore so I suppose I shouldn’t be surprised.

First time I saw an RI was in the mid 60s when he turned up to investigate an interference report my father had submitted – I was about ten and went for a drive with him – he had a ‘Broadcast Interference Locator’ seemed to be a tunable very broadband, very sensitive receiver – and very large, it took up most of the centre of the front (bench) seating position and had more knobs and dials than the space shuttle. Last time was doing commissioning tests on a new transmitter at the TV station in Broken Hill I worked for at the time. It replaced a Pye one that was literally as old as me. Haven’t seen one since and been a ham, on and off, for some thirty years now (didn’t always remember to renew my license in other words).

Just one small clarification of the Australian situation. No CB licence is required except for a CB Repeater, where a licence and annual renewal fee still apply. I'm going through that licencing process presently, as my radio club is planning to move its main 2 Metre repeater to a site occupied by a CB repeater that has been operating since 1989 but has been unlicenced for at least the past 5 years. We need to get that sorted first.

In the USA, a GMRS license is $85 and granted for a period of 5 years.
An Amateur Radio license is $0 and granted for a period of 10 years.

I've maintained my GMRS license continuously since 2002 (back when I
purchased my first 15-channel GMRS only radio).

From: w8jvf@...
Topic: 47330 Message: 47378

I live on Oahu.

All the public safety is trunked 800mhz.

The only thing around is ham repeaters. You can get all those frequencies....

http://www.hawaiirepeaters.net/coordinated.htm
http://www.hawaiirepeaters.net/coordinated.htm

http://www.hawaiirepeaters.net/coordinated.htm
http://www.hawaiirepeaters.net/coordinated.htm

View on www.hawaiirepeaters.net http://www.hawaiirepeaters.net/coordinated.htm
Preview by Yahoo

Also a good site for new hams on Oahu is ....

Emergency Amateur Radio Club - Hawaii http://www.earchi.org

http://www.earchi.org

Emergency Amateur Radio Club - Hawaii http://www.earchi.org Emergency Amateur Radio Club, Honolulu, HI, Hawaii. Ham Radio in Hawaii.

View on www.earchi.org http://www.earchi.org
Preview by Yahoo

There are links there on that page to other pages. AH6RH has a good section for new hams.

If you listen in to the EARC nightly net on 146.880- at 1930 you'll catch on to the way things are kinda done around here. I'm the net controller this monday night, and every other monday night.

Hmm, must admit I haven't looked at the lists for a while and you are quite right, seems to be 21 In SA alone. 12 in Adelaide (this includes WICEN which is more of a national thing IIRC) and 9 in the country. One here and another in Whyalla across the gulf, the rest scattered about a bit. It does seem to have increased dramatically in the last few years, I know when I first renewed my license after some years of inactivity that there were about six going here at the time, not including the local one as the previous Pt. Pirie Amateur Radio Club had folded some time ago. Good to see some resurgence.

Then they announce the UHF CB band and planned to phase out 27mhz for 'industrial' use (at the time a lot of hospital paging systems used 27mhz for some reason). But they moved because of interference and the govt shrugged and decided not to bother – probably have been futile anyway. Then the whole license concept was quietly dropped (only a relatively small percentage bought licenses and there were never going to be enough RIs to police it) so that went out the window as well. Now it's just the Class license for anything but repeaters and it seems that's not terribly well enforced, in part probably due to the reasons you mention. I met my wife at a CB meeting in the 27mhz era – but the club didn't survive into the 80s and I know of no CB club that has. Heck, there are probably less than 30 Ham Clubs in the entire country and many of them are, like the local 'Radio and Electronics Group' formed a few years ago, it's a mix of CB and Ham operators – which seems to work pretty well, they even rebroadcast the WIA Amateur News Broadcast on UHF Ch22 at the same time as the 2M repeater. As a consequence, quite a few CBers have moved on to ham licenses, mostly Foundation, but some have gone on to Standard and Advanced as well – IIRC they license the CB repeater and the 2M repeater – best of both worlds. Still some people on 27mhz – mostly DXers rather than everyday users – some even use legal 27mhz rigs but there's a hard core using Yaesu/Kenwood stuff from last century that still has 27mhz capability – they've cracked down on that a

bit recently, but pretty much only because some were causing serious interference to other services.

I suspect part of the reason this particular CB repeater has remained on air unlicenced is because if the RI wanted to have it turned off, he would need to climb the mountain and do the job himself. The club that established the repeater has been inactive for many years now, so there is nobody the RI can interact with. So far, the repeater's solar cells and batteries have stood up remarkably well.

Yes, quite so, a repeater must be individually licensed. I neglected to mention that. Rptr 4/34 (BLF04) on the Bluff has been there for about thirty years or more. There was (once) a Ch 5 (Emergency) repeater but it’s long gone. There was another on (IIRC) Ch 1 somewhere near Crystal Brook but someone pinched it apparently and the owner decided not to replace it.

I’m a little surprised that a repeater could operate that long unlicensed, but then these days Radio Inspectors are fairly few and far between and don’t seem interested in CB at all anymore so I suppose I shouldn’t be surprised.

First time I saw an RI was in the mid 60s when he turned up to investigate an interference report my father had submitted – I was about ten and went for a drive with him – he had a ‘Broadcast Interference Locator’ seemed to be a tunable very broadband, very sensitive receiver – and very large, it took up most of the centre of the front (bench) seating position and had more knobs and dials than the space shuttle. Last time was doing commissioning tests on a new transmitter at the TV station in Broken Hill I worked for at the time. It replaced a Pye one that was literally as old as me. Haven’t seen one since and been a ham, on and off, for some thirty years now (didn’t always remember to renew my license in other words).

Just one small clarification of the Australian situation. No CB licence is required except for a CB Repeater, where a licence and annual renewal fee still apply. I'm going through

that licencing process presently, as my radio club is planning to move its main 2 Metre repeater to a site occupied by a CB repeater that has been operating since 1989 but has been unlicenced for at least the past 5 years. We need to get that sorted first.

In the USA, a GMRS license is $85 and granted for a period of 5 years.
An Amateur Radio license is $0 and granted for a period of 10 years.

I've maintained my GMRS license continuously since 2002 (back when I
purchased my first 15-channel GMRS only radio).

Luckily NJ is one that does exempt ham radio from the "hands free" cell phone law. I do keep a copy of it in the car just on case I get pulled over. Not every officer knows the full law. The weird part is that it doesn't exempt CB last time I looked. Unfortunately, they are now pulling a "distracted driving law" out of the air (as far as I can determine). Could be a local ordinance in some towns. Don't want to test it in court.

Hmm, must admit I haven’t looked at the lists for a while and you are quite right, seems to be 21 In SA alone. 12 in Adelaide (this includes WICEN which is more of a national thing IIRC) and 9 in the country. One here and another in Whyalla across the gulf, the rest scattered about a bit. It does seem to have increased dramatically in the last few years, I know when I first renewed my license after some years of inactivity that there were about six going here at the time, not including the local one as the previous Pt. Pirie Amateur Radio Club had folded some time ago. Good to see some resurgence.

That depends on which NJ law you look at.

New Jersey Revised Statute 39:4-97.3 "Use of wireless telephone, electronic communication device in moving vehicles" includes an exemption that says "an "electronic communication device" shall not include an amateur radio."

BUT

New Jersey Revised Statute 2C:33-22 - "Possession of emergency communications receiver" has no exemptions at all -- it applies only "while in the course of committing or attempting to commit a crime". So no problem, unless you happen to be stopped for speeding, improper lane change, having a taillight out, or any of the myriad of "crimes" the police can use to stop a vehicle. At which point, your ham radio which is CAPABLE of receiving police frequencies (even if you don't have them programmed in it) becomes illegal.

Australia is very specific. Nothing about scanners at all. (Since Police have been on encrypted digital trunking for some time, it would be pointless unless you like white noise.)

Radar detectors are specifically banned.

Mobile phones are a bit more complex as the law covers exemptions for police and emergency vehicles, and permits use with a handsfree provided you never touch the actual phone.

Two way radio, be it CB, Commercial or Amateur, is specifically exempted, (largely because the Police use them I suspect). It doesn’t mention ‘microphone’ or ‘hand held’ so that would mean using a BaoFeng be it UHF CB, Commercial or Amateur band whilst driving is perfectly legal.

AUSTRALIAN ROAD RULES - REG 300

300—Use of mobile phones

(1) The driver of a vehicle must not use a mobile phone while the vehicle is moving, or is stationary but not parked, unless—

(a) the phone is being used to make or receive a phone call (other than a text message, video message, email or similar communication) and the body of the phone—

(i) is secured in a mounting affixed to the vehicle while being so used; or

(ii) is not secured in a mounting affixed to the vehicle and is not being held by the driver, and the use of the phone does not require the driver, at any time while using it, to press any thing on the body of the phone or to otherwise manipulate any part of the body of the phone; or

(ab) the phone is being used as a driver's aid and—

(i) the body of the phone is secured in a mounting affixed to the vehicle while being so used; and

(ii) the use of the phone does not require the driver, at any time while using it, to press any thing on the body of the phone or otherwise to manipulate any part of the body of the phone; or

(b) the vehicle is an emergency vehicle or a police vehicle; or

(c) the driver is exempt from this rule under another law of this jurisdiction.

Offence provision.

Note—

"Emergency vehicle", "park" and "police vehicle are defined in the dictionary.

Examples of driver's aids—

1 Closed-circuit television security cameras.

2 Dispatch systems.

3 Navigational or intelligent highway and vehicle system equipment.

4 Rearview screens.

5 Ticket-issuing machines.

6 Vehicle monitoring devices.

(2) For the purposes of this rule, a mobile phone is secured in a mounting affixed to the vehicle if, and only if—

(a) the mounting is commercially designed and manufactured for that purpose; and

(b) the mobile phone is secured in the mounting, and the mounting is affixed to the vehicle, in the manner intended by the manufacturer.

(3) For the purposes of this rule, a driver does not use a phone to receive a text message, video message, email or similar communication if—

(a) the communication is received automatically by the phone; and

(b) on and after receipt, the communication itself (rather than any indication that the communication has been received) does not become automatically visible on the screen of the phone.

(4) In this rule—

"affixed to", in relation to a vehicle, includes forming part of the vehicle;

"body", in relation to a mobile phone, means the part of the phone that contains the majority of the phone's mechanisms;

"held" includes held by, or resting on, any part of the driver's body, but does not include held in a pocket of the driver's clothing or in a pouch worn by the driver;

"mobile phone" does not include a CB radio or any other two-way radio;

"use", in relation to a mobile phone, includes any of the following actions by a driver—

(a) holding the body of the phone in her or his hand (whether or not engaged in a phone call), except while in the process of giving the body of the phone to a passenger in the vehicle;

(b) entering or placing, other than by the use of voice, anything into the phone, or sending or looking at anything that is in the phone;

(c) turning the phone on or off;

(d) operating any other function of the phone.

SA NOTE—

For South Australia, in addition to this rule, see regulation 44 of the Road Traffic (Road Rules—Ancillary and Miscellaneous Provisions) Regulations 2014 .

(This basically says a Probationary or Learner driver can’t use a mobile phone while driving. Period. (Even in compliance with the above). However this doesn’t include two way radio as described in Rule 300.

Note that last line -- which is common to many of the laws supposedly exempting licensed ham radio operators. In case you didn't read all the way to the bottom the first time -- it says "set on frequencies exclusively allocated by the federal communications commission to duly licensed radio amateurs." So if your ham radio is capable of receiving outside the ham bands your exemption just went out the window. The exact wording will vary from one state to another, but most that have a ham radio exemption have substantially similar language.

Also note the word "CAPABLE" in the title and again in the first line of the NY law. This word is used in nearly every "scanner" law -- note that the law does not say anything about scanning, only about what the radio is CAPABLE of receiving. The radio does not need to scan to be illegal. The radio does not even need to have any police frequency programmed in it. All it needs is to be able to be set to receive police frequencies and it IS covered by the law.

Subject: Re: [baofeng_uv5r] Is it illegal to hold a portable ham radio/scanner in a car in California? Same with transmit?

Here is NY .... Google is your friend...

New York State Vehicle and Traffic Law
Section 397

The following is the complete text of section 397 of the New York State vehicle and traffic law. This section governs the use of mobile scanners in motor vehicles. Following the statute is a brief summary of the case law relevant to this section.

397. EQUIPPING MOTOR VEHICLES WITH RADIO RECEIVING SETS CAPABLE OF RECEIVING SIGNALS ON THE FREQUENCIES ALLOCATED FOR POLICE USE.

A person, not a police officer or peace officer, acting pursuant to his special duties, who equips a motor vehicle with a radio receiving set capable of receiving signals on the frequencies allocated for police use or knowingly uses a motor vehicle so equipped or who in any way knowingly interferes with the transmission of radio messages by the police without having first secured a permit to do so from the person authorized to issue such a permit by the local governing body or board of the city, town or village in which such person resides, or where such person resides outside of a city, or village in a county having a county police department by the board of supervisors of such county, is guilty of a misdemeanor, punishable by a fine not exceeding one thousand dollars, or imprisonment not exceeding six months, or both. Nothing in this section contained shall be construed to apply to any person who holds a valid amateur radio operator's license issued by the federal communications commission and who operates a duly licensed portable mobile transmitter and in connection therewith a receiver or receiving set on frequencies exclusively allocated by the federal communications commission to duly licensed radio amateurs.

Annotated Case Law 1. Constitutionality.

* People v. McGee, 1978, 97 Misc.2d 360, 411 N.Y.S.2d 514.
* Ruled that section 397 is constitutional and not a preemption of an act of Congress.

2. Legal Purpose.

* People v. McGee, op. cit.

Stated that the rationale for the statute was to prevent criminals from monitoring police broadcasts in their automobiles, prior to or after the commission of a crime. It further stated that the statue protects police radios from jamming and other interference.

3. Definition of Radio Receivers.

* People v. Moore, 1978, 92 Misc.2d 807, 401 N.Y.S.2d 440.
* People v. Faude, 1976, 88 Misc.2d 434, 388 N.Y.S.2d 562.

These two cases established that radar detectors used to avoid police speed traps were not radio receivers because they could not translate the radar signals into a comprehensible form.

* People v. Verdino, 1974 78 Misc.2d 719, 357 N.Y.S.2d 769.

This critical case established that the statue applies to any radio that is capable of receiving police signals whether or not the radio was actually being operated. In this case Verdino was caught with a scanner that operated from the cigarette lighter but was not plugged in at the time he was stopped. The court ruled that the radio was still "capable" of receiving signals thus making it illegal.

4. Issuance of Permits.

* 1975, Op.Atty.Gen (Inf.) 311.

The Attorney General issued an opinion that county boards can designate a person to issue permits only in counties that have a county police department established by a county charter.

5. Confiscated Equipment.

* 1976, Op.Atty.Gen. (Inf.) 255.

The Attorney General issued the opinion that a confiscated radio is not contraband and must be returned to the individual in original condition even if that person has been convicted under section 397.

47386. Re: [Bulk] Re: [baofeng_uv5r] The Ain't No Real FRS Radios Left

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-01 09:52:32 UTC
From: Craig Carnahan
Topic: 47275 Message: 47386

"Try finding them in any real store -- or look for them on the manufacturers website to see if they are in current production."

Based on that version of twisted logic, Xuan, then any model of a Baofeng radio that doesn't appear on the official baofengradio.com manufacturer's website (or show up for sale at your local WalMart, K-Mart or RadioShack) don't exist either, right?

That means the first tri-power BF-F8HP doesn't really exist (as it only is sold on Amazon), and the later tri-power version of the same radio (the BF-F9 V2+) doesn't exist either, right, as neither of them on on the official Baofeng website? Lot's of various versions of UV-5R(whatever letter) and UV-82(whatever letter) don't exist either, right?

Of course, you can go into various stores and buy FRS only radios, just like any Icom dealer nationwide can sell you the Icom FRS radio if you really want one. That doesn't mean that EVERY store will have them, or even that the local sales clerk knows they exist. The same is true for various high end Motorola and Icom products, as I seriously doubt "most" Motorola dealers have sales stock available (just in case you pop in) on a APX7000 radio in your exact requested custom configuration. Most sales clerks are always told to sell "what we have", so there's little chance they would order something different if they can turn the prospect into a stocked product instead.

Given a choice, I personally would not suggest purchasing a FRS only radio, but your claim that they are simply not available for purchase is still wrong. Given the small price difference between a FRS only radio and a FRS/GMRS combo radio, I think you would be better served by buying the combo product, but I've also seen some manufacturers (like Garmin) charge over $499 for a single FRS/GMRS combo radio by adding a simple GPS function and a better display, plus most of the buyers of these combo radios don't realize that as soon as they switch their multi-watt combo radio to an FRS frequency the radio automatically drops in power to a 1/2 watt (so they end up with the same range on FRS frequencies as the guy down the street with a $30 Midland radio - which doesn't make them real happy I'm sure).

Just based on questions that we constantly get at shows (I'm sure Rich would agree), I'd bet the vast majority of all Chinese handheld radios end up with FRS and GMRS channels programmed into them, if for no other reason than it's one of the basic Chirp downloads available. Many hams that I know have various FRS/GMRS/MURS/MARINE band frequencies programmed into their Chinese handhelds for those "emergencies" that we always seem to hear about as well, which probably makes the Baofeng radio product line the number one FRS/GMRS radio sold (legal or not is another issue for another day).

OK, it sounds like all New Jerseans (or is it Jerseyites? I'll have to ask my south Jersey wife.) will need to find and use the old Radio Shack mobiles and hand helds in order to be compliant as they ONLY do the ham frequencies.

I'll be waiting for all the "distress sales" of the now "illegal" mobiles and HTs. Could use a couple of severely discounted Yaesu 8800's.

Stan... in the Grate (misspelling intentional) State of Cumoville, where you cannot own an... OH God... assault weapon.

That depends on which NJ law you look at.

New Jersey Revised Statute 39:4-97.3 "Use of wireless telephone, electronic communication device in moving vehicles" includes an exemption that says "an "electronic communication device" shall not include an amateur radio."

BUT

New Jersey Revised Statute 2C:33-22 - "Possession of emergency communications receiver" has no exemptions at all -- it applies only "while in the course of committing or attempting to commit a crime". So no problem, unless you happen to be stopped for speeding, improper lane change, having a taillight out, or any of the myriad of "crimes" the police can use to stop a vehicle. At which point, your ham radio which is CAPABLE of receiving police frequencies (even if you don't have them programmed in it) becomes illegal.

Luckily NJ is one that does exempt ham radio from the "hands free" cell phone law. I do keep a copy of it in the car just on case I get pulled over. Not every officer knows the full law. The weird part is that it doesn't exempt CB last time I looked. Unfortunately, they are now pulling a "distracted driving law" out of the air (as far as I can determine). Could be a local ordinance in some towns. Don't want to test it in court.

This is such a long thread and has gotten a bit off track from the original questions. Originally the main question was if portable radios were considered the same as cell phones in jurisdictions where cell phone hands on use is prohibited. Scanner use was also included and responded to ad nauseum...

"I know it is illegal to communicate with another person on a cell phone in CA while driving. If all I do is scan or listen to repeaters while driving, can I get into trouble with the law? Would the same be true if talking to a ham buddy?..."

It is possible the response below has been included in this trhead, so forgive me if this is redundant. Back when the California law was being enacted the ARRL had their legal council research it's impact on HAM radio users and this is the response at that time: http://www.arrl.org/news/california-hands-free-law-to-go-into-effect-july-1-ham-radio-not-affected-says-counsel

That second law you mentioned was a rewrite of the old scanner law which was so badly written that you could (and did happen) buy a scanner at Radio Shack, put it in you truck, drive home, get pulled over, car search...you have a scanner in your car! Ticket. Then they started busting hams whose radios go go out-of-band. One local ham who was in the volunteer fire department was busted while he was DFing someone who was jamming the police in the same town! Kind of silly since the cops could hear the jammer on his radio while being stopped, so it wasn't him as they originally thought. Once the new law was enacted, the case was dropped. It was changed so the scanner was illegal if it was used in the commission of a crime. A bit of a stretch for them to "get you" for using a radio to illegally change lanes but with the attitude of some of the police officers, I wouldn't doubt it. The last time I got pulled over (after they saw my antennas) I offered to show my ham license. I kid you not, the officer said, "Oh, OK. I just want to make sure some A-hole cop doesn't pull you over." How do you answer that?
Unfortunately, I've noticed at local hamfests less and less antennas on cars, including VHF/UHF. Shame. Operating mobile is fun.

Thanks for all the valuable info. Looks like bottom line answer is it depends on how knowledgeable the cop that pulls you over is. If he believes your ham license makes it legal to hold a radio, you're ok. Good idea having a copy of my ham license in the car, just in case. I'll try not to rob any banks if I'm found to be listening to police radios.

The reason the thread became so long and divergent is that the answer is different in every state and many cities/counties. AND in many places there are several different laws that can apply to the same radio (NJ was just discussed as one example, but that situation exists in many states because typically a ham radio falls under both any "cell phone" law and any "scanner" law)

Listening to the radio does not involve holding it and would be legal so far as the recent crop of "cell phone" laws are concerned. As others have pointed out, licensed amateur radio operation is usually exempted.

The bottom line however is that you need to read the law in your state (California) or contact a real lawyer -- rather than take the opinion of a bunch of wannabe experts like us.

And then, you should also realize that even if the law does have an exemption that covers your situation, you may still be stopped and ticketed, which will leave you with the choice of paying the ticket or paying to fight the ticket in court.

True. Mine is quick disconnected but is visibly nothing more than 102 inch CB whip (don't want to get more off topic with details but works on all low bands) and CB is so dead around here, they're worth relatively nothing, so fewer "takers". Platform on dash for the radio and the radio comes with me. Sure sign of "no radio in car" (I hope) or it was already taken. I commuted to Jersey City and parked in an open lot (and on the street occasionally) for 34 years without anyone messing with my car (never took the antenna off). Lucky I guess, unless my car being red and having a "strange" license plate had anything to do with it. :) My town is not much better.

As far as on or off topic, the problem is if the radio can be legally used in the car. I remember the old ham licenses stating that they allow you to operate fixed portable or mobile in plain English. Usually answered most questions. Now, legalese. Most cell phone laws are against using a hand held device. . The exemption for NJ's hand held cell phone law came partially from statistics than showed a very small number of accidents (maybe none?) were caused by hams being distracted by using the radio, unlike cell phones. Also the ham community was involved with the design of it. The other problem is could the Baofeng be a "scanner" since it can listen out of band. Our scanner law was changed. Unfortunately, not all policemen are not knowledgeable about the "fine points" of the law. All I can say is check with you state and local laws. In my case, it's been mostly a concern that the antenna doesn't fall off and cause an accident, especially those screwdriver types. Dem is big suckas.

Yeah, I remember those go-go years ... had to keep those scantily-clad females in cages. If they ever got out among the ham operators (some of whom were members of the band? ... the audience?) it would have accelerated the population explosion, even decades before the UV-5R offerings.

That's an easy one, from my defusing-temperament in such a situation: "Well, I'm sure glad that one didn't, sir. Thanks for your good work."

On the contrary if actually cited, one only needs to print the supportive State Law segment as evidence in any traffic-court, and know how to present it to the Judge who provides such instruction and is very forgiving of any lapses of formal legal protocol (other than lack of respect toward The Court and normal human courtesies towards others, including Prosecution (the ticketing officer, who is usually too busy to appear)) ... been there, done that, and have always had charges dismissed, sometimes with harsh wording from the Judge toward Prosecution for burdening The Court with such nonsense.

Some might argue that it's cheaper for them to pay the fine than to appear, but that's their choice ... my lifetime driving record and insurance costs are free of any such encumbrances.

The parking areas around hamfests, as identified by antennas, as well as local restaurants in the mornings and evenings, are where some great contacts are made, I've found.

I wear a UV-5R variant on a belt-clip with a speaker-mic at such events, and often get asked about it. At times I was able to connect to a local IRLP node and participate in (at-home) nets or communications with others who were wondering how the hamfest was going.

I find it sad that you would choose to live in such a place. With all
the repeaters and EchoLink/IRLP nodes available there, why not use a
UV-5R and Tram 1185 mag-mount at such events and stash them out-of-view
when one is outside the vehicle while in any such neighborhood?

No big surprises there, Bob.

Kentucky used to have each formal "Opinion of the Attorney General (OAG)" available online along with the corresponding statutes. Those OAGs are not law per se but they are used by police, and especially be prosecutors, to determine what a law means. The OAGs aren't online now (at least not publicly) but back when they were, we had an OAG that specifically determined that the way the state scanner law was written it didn't matter if the "apparatus" was mobile-powered or AC-powered, didn't matter if it was mounted in the car or simply present in the vehicle, didn't matter if it had any actual police frequencies programmed so long as they COULD BE, and didn't even matter if the radio could actually receive police frequencies if it could be easily modified to do so!

About two years AFTER Kentucky amended the law to exempt licensed amateur radio operators, one teenager had his Radio Shack 2M HT confiscated for violating the law -- yes, he was a licensed ham and had his license with him, yes the radio was the Radio Shack model well known for NOT being able to receive out of band. The cop "proved" that the HT did "receive police frequencies" by keying up his police radio which caused the HT to break squelch!

That second law you mentioned was a rewrite of the old scanner law which was so badly written that you could (and did happen) buy a scanner at Radio Shack, put it in you truck, drive home, get pulled over, car search...you have a scanner in your car! Ticket. Then they started busting hams whose radios go go out-of-band. One local ham who was in the volunteer fire department was busted while he was DFing someone who was jamming the police in the same town! Kind of silly since the cops could hear the jammer on his radio while being stopped, so it wasn't him as they originally thought. Once the new law was enacted, the case was dropped. It was changed so the scanner was illegal if it was used in the commission of a crime. A bit of a stretch for them to "get you" for using a radio to illegally change lanes but with the attitude of some of the police officers, I wouldn't doubt it. The last time I got pulled over (after they saw my antennas) I offered to show my ham license. I kid you not, the officer said, "Oh, OK. I just want to make sure some A-hole cop doesn't pull you over." How do you answer that?

Unfortunately, I've noticed at local hamfests less and less antennas on cars, including VHF/UHF. Shame. Operating mobile is fun.

Luckily NJ is one that does exempt ham radio from the "hands free" cell phone law. I do keep a copy of it in the car just on case I get pulled over. Not every officer knows the full law. The weird part is that it doesn't exempt CB last time I looked. Unfortunately, they are now pulling a "distracted driving law" out of the air (as far as I can determine). Could be a local ordinance in some towns. Don't want to test it in court.

Well would you strip my tires and steal my Uv5R from my car? That is
the question to ask.. you know petty politics and all.

You’re the man of experience on theft and these kinds of things.. to give
good advice in here.

Thanks for the advice though,

You forgot to mention the weather in WA? How is it there?

Having just caught up with the past couple of weeks worth of messages, I refer back to the interference thread.

At a recent ham field event, we had a "buzz" in the receivers that had not been there during the previous event set-up - tent, batteries, generator etc).
After a bit of chasing, it turned out to be the newly replaced LED globes running off the batteries. We had a couple of models plugged in, the originals were fine, but the new ones were acting as a VFO - assumed to be set to reduce power usage by flashing on and off faster then the human eye can see.
We unplugged the 2 new globes and the buzz went away.

Earl,
I am in Ontario myself, but I have heard, (and please correct my if I'm wrong on this), that in British Columbia it is actually illegal to display/use a ham licence plate unless you have a transceiver carried in the vehicle. (I don't know whether has to be mounted or not.) It is apparently a provision for drafting folks into forest fire fighting, where the services of hams can come in handy for communications purposes.
Can you shed any light on this? Thanks,Ian

  Up here in British Columbia Canada this becomes a bit weird. As long as a ham is displaying their ham licence plate it is perfectly legal to use their radio while driving. However (this is where it gets weird) the radio must be permanently mounted and must be operated by the microphone. Our UV5Rs would be legal if they were permanently mounted and used with a remote speaker/mike. However they would not be legal if they were used handheld. EarlVA7EWG

If the radio involved is an HT capable of transmitting on a Ham frequency
but receives on other freqs the FCC has preempted any state or local law
which prevents a Ham possessing or using it in a motor vehicle. See ttched
PR
91-36.

OHHH...

I almost forgot one.

SOLAR PANELS!!!

Yes... We have a LOT of solar panels going up in Hawaii, and they get hooked back into the grid. When you get about 3 or 4 of these things in a row... that's when the interference starts. You get a whole neighborhood hooked up and pumping back into the grid... WOW what a bunch of noise. 40 meters is the worse! I know this is a Baofeng thread, but I'm sure most of the people here play HF too. Yeah all the energy efficient stuff really pumps out the RF in the HF bands.

I know this is a Baofeng thread, but I'm sure most of the people here play HF too. Yeah all the energy efficient stuff really pumps out the RF in the HF bands.

47414. baofeng as a mobile vs a FT-2900R

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-03 04:31:45 UTC
From: Joe
Topic: 47408 Message: 47414

I've got a Tram 1185 antenna for mobile use and with the Baofeng it seems to work well hitting local repeaters. The charging of the Baofeng and constant connecting/reconnecting to my antenna is a pain. So I bought a Harbor Freight inverter for my car so I could just use the Baofeng charger in the car and not have to remove the radio and bring it into my house to charge. That helps some, but it's a messy pile of wires in my car. Is a 75W Yeasu Ft-2900R a huge upgrade as far as distance, clarity, and features goes over a Baofeng? I realize I'd lose 6M which I've never used. But I would get rid of my wire mess, and be able to pump out 75W when required. I also would be able to do real scanning of channels. The FT-2900R is $149 with rebate at Universal Radio and I'm seriously thinking about one.
- Joe

SAR teams that I am involved with seem to like a VERY expensive brand led headlamps.However, they have found that at night they can get a lot of interference on the HT's !The lights are great little search lights though.

Subject: [baofeng_uv5r] Interference

Having just caught up with the past couple of weeks worth of messages, I refer back to the interference thread.
At a recent ham field event, we had a "buzz" in the receivers that had not been there during the previous event set-up - tent, batteries, generator etc).After a bit of chasing, it turned out to be the newly replaced LED globes running off the batteries. We had a couple of models plugged in, the originals were fine, but the new ones were acting as a VFO - assumed to be set to reduce power usage by flashing on and off faster then the human eye can see.We unplugged the 2 new globes and the buzz went away.

You will note, however, that PR 91-36 does not cover the BaoFeng HTs, or any of the other inexpensive Chinese HTs or mobile radios

Subject: Re: [baofeng_uv5r] Is it illegal to hold a portable ham radio/scanner in a car in NJ [1 Attachment]

If the radio involved is an HT capable of transmitting on a Ham frequency but receives on other freqs the FCC has preempted any state or local law which prevents a Ham possessing or using it in a motor vehicle. See ttched PR
91-36.

47430. UV-5RTP Review

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-04 08:09:56 UTC
From: w8jvf@...
Topic: 47430 Message: 47430

So I came across this little radio at Radioddity...

http://www.radioddity.com/us/home-two-way-radio/baofeng-uv-5rtp-two-way-radio-dual-band-136-174-400-520mhz-tri-power-1-4-8w.html http://www.radioddity.com/us/home-two-way-radio/baofeng-uv-5rtp-two-way-radio-dual-band-136-174-400-520mhz-tri-power-1-4-8w.html

Had a $50.00 gift card to blow, so I figured what the heck. I'll give it a shot. So I got it in a week ago, and gave it a go.

First off I have to say that if you like the UV-5R's, you'll still like this radio. On the outside, it's EXACTLY like the old UV-5R's so there's really not a learning curve. But there are a couple of operating differences.

The second thing I noticed, it seems to weigh just a little less than the BF-F8HP, but that may be the cosmetics involved. It has the classic speaker grille and not the "fancy" metal under plastic the F8HP has. It also has a BAND button, which works, but is not needed. There is no "beep bug" on this radio, which was my greatest fear. That would have meant old firmware, but it's new firmware and everything seems to work great.

The radio puts out a solid 7.5 watts on my high tech cross needle SWR/WATT meter, and holds that power throughout the VHF Band. Performance on the UHF band is similar with the power around 6.5. I know it's not very accurate, but I've never had the need for an "accurate" watt meter.

When programming, use the BF-F8HP software, or use the BF-F8HP settings in CHIRP. DOWNLOAD A FACTORY FILE FIRST AND SAVE IT just in case you try and program it with the UV-5R software, that way you can "unbrick" it.

The radio comes with the lousy stock antenna, http://www.radioddity.com/us/radio-accessories/antenna/original-baofeng-sma-female-antenna.html http://www.radioddity.com/us/radio-accessories/antenna/original-baofeng-sma-female-antenna.html

and that's a shame. Buy Two Way Radios and Baofeng Tech put the upgraded antennas on theirs, and I hate to admit it but Baofeng has a winner with that antenna.

http://www.radioddity.com/us/radio-accessories/antenna/original-baofeng-sma-female-18cm-high-gain-dualband-antenna.html http://www.radioddity.com/us/radio-accessories/antenna/original-baofeng-sma-female-18cm-high-gain-dualband-antenna.html

It's durable, and performs nicely. I've used it extensively and had little to no problems with it. BUT it still doesn't have the punch of the Nagoya 771. I did purchase the SainSonic antenna though ...

http://www.radioddity.com/us/radio-accessories/antenna/sainsonic-inf-641-144-430mhz-23cm-sma-female-2-15dbi-dual-band-antenna.html http://www.radioddity.com/us/radio-accessories/antenna/sainsonic-inf-641-144-430mhz-23cm-sma-female-2-15dbi-dual-band-antenna.html

and LOVE it. It's VERY skinny and when I slip it on the radio, it's like an unobtrusive little wire sticking out of my day-pack. But the thing performs VERY well. I would actually say it is as good as my Nagoya 701. It's lighter, and VERY flexible. The only thing I worry about is possibly breaking it, but I'm not using radios like I used to (dragging them through fires and such).

Sound quality is good both transmit and receive, and it seems to hold frequency very well.

OK... now the bad...

The website advertises that it has the ability to store 25 FM channels, and I can't find that option ANYWHERE. The bug is still there where if you are listening to the radio, have the backlight set to more than 8 seconds, and have the power save on... it will screw up the radio reception after a QSO. The cloning function is not available, and can't get it to work on the BF-F8HP with updated firmware either. But it will work on the BF-F8HP with the beep bug.

Bottom line???

Pretty good little chunk of radio for the price. It fits all the UV-5R accessories (fitting the extended battery was a MUST for me), and I do like the fit and feel of the radio. Pairing it with the Sain Sonic antenna I paid about $5.00 less than the BF-F8HP. But the thing with Radioddity.com is that if you keep checking their site they tend to discount their stuff at random times. I've recently gotten a KG-UV8D for $98.00, and technically got the UV-5RTP for about $51.00 with the Sain Sonic antenna, because they were running a %10 off coupon also.

I've got WAY too many radios. I think I'm gonna sell some of them soon.

Sounds like Pofung is making progress on the radio design.
The biggest problem I have had with the little UV-5R and variants is poor receiver selectivity and the lousy/non-adjustable squelch.

Would you be so kind as to comment on if these aspects of the radio have been improved?

Thanks,

NV7V

This capability isn't available in CHIRP (yet).

I am working on it and wouldn't mind a few testers.

The oldest radios must get the settings from firmware and can't be adjusted. My UV-5R with BFB231 firmware can't be adjusted.

I first tried this out on a UV-82L with success. Then later on a GT-3. Earlier this week, I got to try it on my own UV-82 and BF-F8HP radios. The difference is amazing. I don't know why Baofeng ships these radios with the squelch so "broken".

Contact me with your radio model and "real" firmware version if you would like to test this. I can either edit your CHIRP "image" file or I can email you a "module" so you can make your own adjustments. I would like some feedback in return.

Send and email to: squelch [at] kc9hi [dot] net

Well, as to selectivity, it's not too bad. I live in a high RF area anyway (Honolulu Metro plus living on military base) and therefore it doesn't matter what radio you have, you're going to get some bleed over. BUT I have tested in that I placed the radio on the roof of my car, had the Baofeng/Pofung tuned to 145.450, then on the mobile rig started at 145.650 at 50 watts, and worked my way down. Squelch was set to 3, and the HT radio had high gain antenna. Results, got down to 145.550 before breaking squelch, then 145.495 before holding it open. Yep, it's a hillbilly way of doing it, but it's as real world a test as I could come up with. UHF was the same, but had a .045mhz spread before actually holding open the squelch.

SO... real world? Works fine. I don't have any bleed over from any adjacent frequencies. But when I travel down by the docks and the USCG station? Yeah intermod EVERYWHERE and in downtown Honolulu. You just CAN'T escape it. Even my FT-857 running mobile gets the intermod.

As to the squelch, I just don't see the how it's all that much more difficult than some of the others. You don't even need CHIRP to program it. When you turn your radio on, the menu defaults to the beginning... menu 0. Menu 0 is SQL... Super easy to change... just hit Menu... then 0... then up or down or 1-9... then menu again. Squelch is set. And I know there's going to be at least ONE comment about how if you had a separate squelch knob ... yadda yadda yadda... yeah well I also didn't pay 300.00 for this radio either. I also like not having to fiddle with an extra knob.

Turn it on, pick yer channel, then hold a QSO. Simple. I usually have my SQL set to 4 or 5, but usually it stays at 4 and I don't have any problems.

OK... I hope this helps. it's an inexpensive software defined radio that is a little sloppy on some of the receives, but it's not so sloppy that you're going to get over a .075mhz bleed over. At least I haven't

Hope this helps...

Hello Jim,

I am happy to try it out so long as my rig does not end up as a brick!

The UV-5RE is running BFP297 and the CHIRP version is 0.4.1.

Cheers

John - G8MWF

Subject: Re: [baofeng_uv5r] CHIRP Squelch Threshold Adjustments

This capability isn't available in CHIRP (yet).

I am working on it and wouldn't mind a few testers.

The oldest radios must get the settings from firmware and can't be
adjusted. My UV-5R with BFB231 firmware can't be adjusted.

I first tried this out on a UV-82L with success. Then later on a GT-3.
Earlier this week, I got to try it on my own UV-82 and BF-F8HP radios.
The difference is amazing. I don't know why Baofeng ships these radios
with the squelch so "broken".

Contact me with your radio model and "real" firmware version if you
would like to test this. I can either edit your CHIRP "image" file or
I can email you a "module" so you can make your own adjustments. I
would like some feedback in return.

Send and email to: squelch [at] kc9hi [dot] net

Hi John,

You really shouldn't be using the CHIRP stable build (v0.4.0 or v0.4.1) with a Baofeng radio other than a UV-B5 or UV-B6. Baofeng make a memory layout change with with introduction of the N5R firmware and cross-loading a BFB/BFS image into a radio with N5R firmware or uploading a N5R image into a radio with BFB/BFS firmware will cause the receive to be muted. The daily builds from October on prevent the uploading of an incompatible image into a radio. The stable builds do not do this.

How old is your radio? BFB297 (I assume that BFP is a typo) hasn't been shipping for quite some time. All firmware variants of UV-5R variants all masquerade as BFB297 with the [3] key + Power-on message, but that is no longer the "real" firmware version. The "real" firmware version is available on the CHIRP Settings -> Other Settings menu panel (Firmware Message 1).

You won't "brick" your radio. Most of the people that are causing their radio's receive to be muted, are those that continue to use the stable. They uploaded an incompatible image file into their radio. All they would have had to do is to upload their original CHIRP backup image and their radio would have been fine. But most of them didn't know or never bothered to save a working image first.

If you don't like the results of the squelch changes or they don't make any difference, then all you need to do is upload your original "image" back into your radio. It will then be exactly as before.

So email me you CHIRP image file. I can either edit it here, or I can send you a CHIRP module to temporarily use to alter the settings yourself.

Do you mean will it work with N5R-20 firmware? I think so. That is
what I am trying to find out.

I works with my BF-F8HP with N5R-30 firmware. It worked in a GT-3 with
N5R-213 firmware.

Yep... I'm sitting right smack dab in the middle of RF Hell central oh Oahu.

Doesn't matter if it's HF, VHF, or UHF.... you get it all here. I like to think of it as a challenge, especially in the HF realm. Other than that, you find that the Hams here are VERY helpful. I kinda like it.

Hello Jim,

Thanks for the information – I am still very new to this radio and CHIRP and need all the help I can get!

The firmware is N5R-213.

The current image is also enclosed.

I was unable to get the VIP software supplied with this radio working and since CHIRP worked first time I stuck with it.

The point you made about CHIRP releases is noted but as a new user to CHIRP I do not have a clue as to which release is 'safe' to use and have erred on the cautious side!!

If you can point me in the right direction of which version of CHIRP is currently most suitable I would be grateful.

Thanks for your help.

John,

Here is your .img file back with the updated squelch settings. Make sure you have a backup image before you get started. I now have a backup here. ;-)

I believe that you will now find that Squelch 9 can really squelch out stronger stations and you will have to reduce squelch to 6 or maybe 5 for normal operation.

If you like these settings, don't upload any other image file into your radio or they will be reset to the values in that image file. If you don't like these settings, or that don't appear to do anything, then just upload your original image file and everything will be as is was before.

From: w8jvf@... [baofeng_uv5r]
> As to the squelch, I just don't see the how it's all
> that much more difficult than some of the others.

The issue people have with the squelch on the BaoFeng (and other Chinese) HTs isn't that it is difficult to set but rather that in most cases the practical choice is just ON or OFF, with 0 being OFF, and anywhere from 1 to 9 being "on" with very little difference in the signal strength actually needed to break the squelch.

This is a common complaint with many recent radios that use a digitally controlled squelch rather than the "old fashioned" (analog) knob adjusting a variable potentiometer. The mainstream (Japanese) ham radios seem to provide a wider range between the lowest and highest settings - which can be VERY useful in an RF rich environment or if you use the radio in different ways at different times. For example, in my car I would often rather have the squelch set high enough to block anything short of a full quieting signal, while at home I am more willing to listen to weaker signals.

Seems to work fine – thank you!

I will see how it performs over the next couple of weeks, with different traffic conditions, and let you know the results but so far it is encouraging.

Two more questions -

1. Do I need to update the UV-5R from N5R-213?

2. Is there a ‘good’ version of CHIRP that I should use instead of 0.4.1?

Cheers

OHHH.... didn't know that there was that problem with the squelch's (or however you spell it). I just never really paid attention to it. I guess when you're used to working with public service radios for 20 years, squelch wasn't much of an issue. BUT I can see if you're trying to pull in weak stations where the squelch would be an issue. I'll play with it more when I'm in Ohio for a couple of months.

Yeah the scenery is GREAT and the weather is GREAT ... but trying to get a closer look at some of that scenery (i.e. getting to a beach) is even WORSE than the RF hell. Plan on spending at least one hour to get ANYWHERE, and if you want to cross to the north shore... give yourself 2 hours. I SOOOOO hate the traffic.BUT there's a lot of people talking ham radio while you may get caught in traffic which makes the drive not so bad.

Tony,

The file I attached was for John only. I requested that everyone contact me direct and gave my email address. When I got up at 4:30 am and saw John's email with his CHIRP image attached, I assumed it was direct from him and didn't notice that it was an email to the group. :-(

If you want to try this out on your BF-F8HP, email me your .img file to the email address I posted earlier.

I don't need everyone cross-loading .img files that weren't intended for them. I'll wind up helping them recover from their mistake. My time would be better spent getting this implemented in a daily build of CHIRP.

The point of the testing it to find out what it works with. I have reports now that it works with radios with BFB293 firmware. My feeling is that this have been something that could have been leveraged since BFB291.

47460. Annoying click in headset

Yahoo group: baofeng_uv5r (2015)

From: rmaddy@...
Topic: 47460 Message: 47460

I have a motocomm headset for a fullface helmet. I just tried it for the first time with a new UV-5RE radio.

It's working in general but there is one issue I'd really like to solve.

There is a rather loud click or pop in the earpieces whenever a button on the radio is pressed or when a transmission is first received. This click is just as loud even when the volume is turned all the way down.

Is this normal for this radio (I hope not) or is there a setting to help with this?

It's a standard headset that I've used for years with a Vertex Standard VX-150. I simply swapped out the radio connector plug with the standard Kenwood/Baofeng connector. It's all plug and play. No issues with the VX-150, just the UV-5R.

I've complained about this before. It's just how they are. Even if you use the in-ear phone that comes with the radio you will hear it. LOUD pop at all changes in audio (start and stop). Sadly, I don't think there's anything that can be done about it. Both my UV-5R and BF-F8HP exhibit this. There needs to be some kind of circuit that smooths the transition, but alas, I guess nobody in China uses these radios with phones. Sadly, I have just accepted the fact that I will never use these radios with phones.

47464. Bricked Radio, Possible using Chirp

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-06 04:51:04 UTC
From: wayfarer123@...
Topic: 47464 Message: 47464

I'm not completely certain chirp is to blame (and not complaining about a free program regardless) as I did not try to transmit before programming this radio (I was unlicensed at the time). However, I read some bug reports that are very similar to my issue though, so I suspect it was a Chirp thing. I have a UV-5RA firmware version N5R-219. My issue is that I cannot transmit, or at best can only transmit intermittently. I have been able to give myself intermittent transmit capability by opening VIP and programming all defaults; then, if I hold the ptt button and talk into the mic, it will cut in after a several seconds then cut back out. It's flaky at best to reproduce this. I have an unbrick image from a post by Dan Smith on the Chirp site but I'm not sure if its compatible with my firmware version. Any advice on how to proceed? Thanks (Using Chirp 0.4.1, which I believe to be the latest stable release)

47468. Re: [baofeng_uv5r] Federal Preemption of State Scanner Laws

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-06 06:24:02 UTC
From: Xaun Loc
Topic: 47348 Message: 47468

READ the FCC statement again. It addresses ONLY the ability of amateur radios to receive out of band and specifically does not address radios with an out of band transmit capability. Also, while older state so-called "scanner" laws generally banned radios "capable of receiving" frequencies assigned to the police, several states have already modified their laws to exempt amateurs whose radios receive police frequencies provided those radios do not have the ability to transmit on police frequencies.

Trying to get a blanket exemption for the ability to transmit would be a much tougher problem -- especially since the "receive only" issue was a key argument in the positions advanced by the ARRL and others, as well as in the support from APCO.

Having the ability to transmit out of band does not, itself, make the radios illegal - but it does take them outside the scope of the blanket federal preemption. In some states the state laws say nothing at all about transmit capability, but quite a few states already make the distinction and more will surely follow.

I have been following this thread but am a little lost. I have the BFF8+ and UV82 models and can set squelch from 0 - 9 from CHIRP or keyboard. Are you saying that you have a way to make the squelch steps have wider spacing so they are more effective, or are there some radios where you cannot set the squelch from CHIRP and you can enable that function?

If I can be of help with your research testing, my BFF8+ radios are #1 BFS313, #2 BFS297 and the UV82 radios are B82S25 from the CHIRP Profiles. They all have squelch adjust capabilities in the CHIRP menu which works. Settings 0 - 2 make significant differences, but above that less so.

I also have some UV3R+ and UV3R Ml II models which also can be set from CHIRP.

Thanks very much for your efforts. Baofeng should be sending you royalties!

Yeah... I think you've pretty much answered your own question. There is very little difference from one setting to the next over the 9 settings. Basically you have two choices; squelch open/off and squelch closed/on. The adjustments allow the threshold of each of the 9 settings to be altered.

I don't need any more testing. I submitted a patch last night. I am just waiting to hear that is has been approved and then it should be available in the next CHIRP daily build.

Well all, this is a bit embarrassing, but it looks like it wasn't a chirp issue at all. User error on my part, at least partially. I was using an FRS radio for debugging purposes, and it turns out it had a squelch tone active. Disabling that let me listen to the transmission. I also pulled out a police scanner that I remembered I had and tuned to the transmit and receive frequencies of some repeaters I was trying to hit. I could always hear my transmissions, never anything on the repeater. One of these repeaters (70cm) is less than 2 miles away, but I do live in a brick house with plaster walls. I even parked across the street from that repeater though and couldn't get so much as a kerplunk (a couple days ago, but I suspect the radio was fine given my current findings). Very frustrating. I may have to do some distance tests with the FRS radio. I'm using the rubber duck antenna but I would think that would work at close distances. I've triple checked my frequency, offset, and tone now. Maybe I'll turn it over to one of the more experienced hams at work and see what they find.

Subject: Re: [baofeng_uv5r] CHIRP Squelch Threshold Adjustments

FYI here is the squelch function example. For those
interested in what Jim is doing.
Some info for the chipset settings

How the DBM thresholds are calculated into a binary format for the
settings

SQ
Bit
Name
Function
30H[3]
sq_on
1 = on, then chip auto sq
0 = off
45H[3]
ctcss_sel
1 = ctcss_cmp/cdcss_cmp out via gpio
0 = ctcss/cdcss sdo out vio gpio
45H[10]
css_det_en
If 1, sq detection will add ctcss/cdcss detect result, then 1846 control
1846 voice output on or off.
48H[9:0]
th_h_sq<9:0>
Sq open threshlod
Sq detect high th, rssi_cmp will be 1 when rssi>th_h_sq, unit
1/8dB
48H[9:3] = Binary (135+ Sq open threshlod)
49H[9:0]
th_l_sq<9:0>
Sq shut threshold
Sq detect low th, rssi_cmp will be 0 when rssi<th_l_sq && time
delay meet, unit 1/8 dB
49H[9:3] = Binary (135+ Sq shut threshlod)
54H[7]

sq_out_sel
If 1, the output gpio6 is sq & css_cmp;
Else, the outputp gpio is sq only.
Auto SQ set 30H [3]=1(sq_on).
If auto SQ and subaudio detected at the same time,45H [10]=1 must be set.
48H[9:0] is Sq detect high th,49H[9:0] is Sq detect low th.
Such as Sq open threshold=-120dBm and Sq shut threshold=-122dBm
So 48H[9:3]= Binary (135+(-120))=0001111, 48H[9:0]= 0001111000
49H[9:3]= Binary (135+(-122))=0001101, 49H[9:0]= 0001101000

The genuine Nagoyas have a tapered base with gray print. The counterfeits have a stepped base with blue print. However I have both and haven't found a noticeable difference in performance or fit.

I have found a bit better performance from both the Diamond SRJ77CA and the Comet SMA24J. You can test antennas all day and the difference may not be meaningful tough if you can hit what you want anyway.

There are legitimate Nagoya's with Blue Print.

I read in a MIKLOR web site that there are some False usb profilic cable or false profilic pl-2303 .

I have this china (clone ?) cable, buy by amazon :

http://www.amazon.it/gp/product/B007VMA6TK?psc=1&redirect=true&ref_=oh_aui_detailpage_o01_s00

In how mode I say if is this cable is a FTDI, or Proflic or PL-2303 or a bad clone ????

My very big problem is that when I used this clone cable buy by amazon on windows xp
All ok, I read and write on my baofeng UV-5R

But when I use a live cd with ubuntu and CHIPR (update today !!!) version is now:

DAILY (20150102) GTK 2.24-10 Pyton 2.7.3 PYGTK 2.24.0

The problem is that with ubuntu (linux distro) the cable not work and the baofeng always go to TX !

Why it work well on windows xp , but not work with Chirp on ubuntu live cd distro ????

Thanks for help. Best 73

PS the version on my baofeng UV-5R is BFS 297 buy on july 2014.

Actually, your low volume when using the Baofeng is most likely from volume input to the microphone.

Basically, you either have to have a loud voice, or you need to hold the radio closer to your mouth. And the place you need to aim your voice is that little hole just above the A/B button. If you try to talk into the speaker grille, your voice becomes muffled and "low" in volume.

Nagoya makes a good antenna. But lately I've been experimenting with the SainSonic antennas from radioddity. REALLY skinny and light.

The Nagoya 771 works great for me. Even inside my aluminum siding house I'm good with repeaters 10 miles away. For in my car I use Tram 1085
 http://www.amazon.com/Tram-1185-Amateur-Dual-Band-Antenna/dp/B0045EQUBK
with the adapter DHT Handheld Antenna Cable for Wouxun Baofeng Quasheng Linton - Adapter for UHF Base and Mobile Antennas - SMA Female to UHF SO-239 Female Connectors 6'' and I get great "full quieting" signal reports. For inside the house use the Tram antenna on a big flat pan baking pan or a big round pizza pan for best output.

  What antennas are working great for you guys? I just recently bought my Boafeng and I bought a Nagoya NA-771. I have no idea if it's a genuine or not. Haven't used the stock rubber ducky, just the Nagoya.
I've had a few of my contacts tell me I was coming through low. They would have to turn up their volume. What can cause that?Thanks

There is also an occasional problem noted with the UV5R series where there is a tiny little piece of plastic flashing left covering part of the tiny microphone hole. There are basically 2 fixes, 1) disassemble the radio and remove it from the inside (the safe way if you know how) and 2) use a tine drill bit the size of the outer hole and clear out the hole without going too deep and destroying the microphone. How deep is too deep I wouldn't risk the #2 method.

But with this problem your modulation would be very low when you are in close range.

This is Oregon's law on this subject

811.507[1]
Operating motor vehicle while using mobile communication device

- exceptions
- penalty

(1) As used in this section:

(a) Hands-free accessory means an attachment or built-in feature for or an addition to a mobile communication device, whether or not permanently installed in a motor vehicle, that when used allows a person to maintain both hands on the steering wheel.

(b) Mobile communication device means a text messaging device or a wireless, two-way communication device designed to receive and transmit voice or text communication.

(2) A person commits the offense of operating a motor vehicle while using a mobile communication device if the person, while operating a motor vehicle on a highway, uses a mobile communication device.

(3) This section does not apply to a person who activates or deactivates a mobile communication device or a function of the device or who uses the device for voice communication if the person:

(a) Is summoning medical or other emergency help if no other person in the vehicle is capable of summoning help;

(b) Is using a mobile communication device for the purpose of farming or agricultural operations;

(c) Is operating an ambulance or emergency vehicle;

(d) Is 18 years of age or older and is using a hands-free accessory;

(e) Is operating a motor vehicle while providing public safety services or emergency services;

(f) Is operating a motor vehicle while acting in the scope of the persons employment as a public safety officer, as defined in ORS 348.270 (Scholarships for children of public safety officers and former foster children);

(g) Is operating a tow vehicle or roadside assistance vehicle while acting in the scope of the persons employment;

(h) Holds a valid amateur radio operator license issued or any other license issued by the Federal Communications Commission and is operating an amateur radio;

(i) Is operating a two-way radio device that transmits radio communication transmitted by a station operating on an authorized frequency within the citizens or family radio service bands in accordance with rules of the Federal Communications Commission;

(j) Is operating a vehicle owned or contracted by a utility for the purpose of installing, repairing, maintaining, operating or upgrading utility service, including but not limited to natural gas, electricity, water or telecommunications, while acting in the scope of the persons employment; or

(k) Is using a function of the mobile communication device that allows for only one-way voice communication while the person is:

(A) Operating a motor vehicle in the scope of the persons employment;

(B) Providing transit services; or

(C) Participating in public safety or emergency service activities.

(4) The offense described in this section, operating a motor vehicle while using a mobile communication device, is a Class C traffic violation.

(5) The Department of Transportation shall place signs on state highways to notify drivers that violation of this section is subject to a maximum fine of $500. [2007 c.870 §2; 2009 c.834 §1; 2011 c.530 §1; 2013 c.757 §1]

47506. UV-5R BFB251 VFO Problem...

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-08 03:02:51 UTC
From: a.liette@...
Topic: 47506 Message: 47506

Hello, all. I picked up an older UV-5R recently, and the first thing I came upon, was the VFO only will show /36.000 for VHF. It shows a slash rather than a 1 in the first digit, and won't tune up or down, nor can I enter a VHF frequency. UHF works fine, and I can program both bands from Chirp.

Is this a known problem? I wonder also if there is a fix, or just a bug in the BFB251 firmware?

Thanks for any help or info.

Adam, N8YD

47508. I am looking for a Baofeng UV-5R Disc Image

From: paulandreasen@...
Topic: 47510 Message: 47510

I wonder if anyone has a thought on this problem. I have several of the UV-5RAs, and they work great! Literally better than my T90-A which cost what a few dozen (many dozen?) of these cost! But... (there always is one, huh?) While the normal conversations are at a very good volume level, when ANY repeater I listen to ends the transmission, the squelch tail audio is several times what the conversation level is! I mean a difference of almost making you jump if it surprises you. VERY hard on the ears!
Has anyone else run into this? I have a UV-5R, 3 UV-5RAs, and an older one (no label) I think is a UV-5B?

Sure, just ship someone your radio and have them program it for you since you are unwilling to look up how to program your own radio and don't comprehend that each image is only valid for a specific firmware version.

Hi Fred,

I am in the UK, so no image here of use to you. However, you do NOT want a disk image of anyone's radio. What you need, (using CHIRP) is a file that someone has exported from their copy of CHIRP as a csv file.

Then, you "read" your radio, and save the resulting image file someplace safe, then IMPORT the csv file to your image, and save that with a different file name, then upload THAT to the radio.

Basically, an image file of the radio that you asked for contains the way your radio uses its memory. You get one from somebody else, and your radio may not like what it then gets.

By using the above procedure, you get YOUR radios memory map by reading from your radio, put the contents of the csv file into it, and then put YOUR memory map back into YOUR radio with the contents of the csv file included. (Which is all the channels, power settings, duplex, you name it).

Check out "CHIRP" (http://trac.chirp.danplanet.com/chirp_daily/LATEST/), and also check out the miklor site (www.miklor.com) and ensure your programming cable is either genuine, or uses the old drivers.

Using the above procedure has allowed me to have programmed a UV-3r, several UV-5Rs, and a Wouxun UV8D all with the same channels.

Getting a useful list of channels is best done (by csv file as above) from a local ham, who will already know where the local activity is.

It can be hard work figuring it all out yourself. I am more than happy to give my locals my files, (I have, many times), but our bands and such are different, so it will be no good to you.

Enjoy the radio, it has given much joy in my area and rekindled the interest of a lot of folks.

Regards and 73,

Stan, G4EGH

the easiest thing to do is to download chirp,set it up to communicate with the radio and the computer,go to www.RadioRefference.com and set up a free account.when you get chirp set up and the radio connected at the top of chirp program you can import frequencies from other sources under one of the tabs at the top of the program and then upload to the radio...

My reading of the decision is that an HT with the capacity to transmit on Ham Frequencies
falls under the federal preemption. The salient fact is their ability to transmit on Ham Bands.

Of course there are also guys that will hang a J-pole off their kitchen light inside the house, run 100 ft. of RG-8X to their Baofeng handheld while sitting in their recliner and swear that you can't possibly be talking simplex to other folks that they can't hear, because everybody's signal on "their" station is always full scale.

Whoever told you that didn't know their cable loss factors very well.

http://www.arrg.us/pages/Loss-Calc.htm

Belden RG-8X 100ft 2-1 SWR 144MHz 1W becomes .356W

Not likely to make much difference if you were full quieting a 1W.

Many don't understand SWR and the fact that it reflects back forth losing power each time but eventually going out the antenna. With a lossless cable 100% of the power would always go out regardless of SWR. The voltages might bite you though.

For a good description here's a nice paper on it.

http://www.arrl.org/files/file/Technology/tis/info/pdf/q1106037.pdf

What type of antenna is it going into?

If you're doing VHF, you're only loosing about 4- 4.5 dB to the antenna on 100ft.That drops 1 watt to like .3 watts, but if you've got a high gain antenna of say 5 db or something you'll "gain it back" so to speak. (can't wait for the comments on that statement). But it must be one like 13 element beam or something to hit a repeater 50 miles away. It's probably scratchy as heck though.

From: Xaun Loc
Topic: 47482 Message: 47524

If the antenna was perfectly matched to the radio & feedline and perfectly resonant at a 2M operating frequency, with 1 W into 100 ft of RG8X, you would have a loss of 4.245dB giving you just over 1/3 W reaching the antenna (376mW) -- with a 1/4 ground plane, that would give you a signal pretty much the same strength as if you were standing at that same height using the HT with its stock rubber duck.

Hardly great, but certainly not hopeless.

Now, if you were operating through a 70cm repeater, you would have 7.978 dB of loss, giving you a maximum of 159mW reaching a perfectly matched resonant antenna, which would be pretty pitiful

Well, I did a sanity test with a coworker's UV-5R and mine is definitely bad. We looked at a few repeaters ranging 2-15 miles away - same frequencies, same offset, same tones, both tx power high. My coworker had a slightly better antenna, but he hit all of the repeaters we tried (both radios registered the chirp after he transmitted). I couldn't hit any. Then we swapped antennas. I managed to hit one 70cm (2 miles) repeater. No luck with the others, and even that one was inconsistent. He hit every one of the repeaters we tried again with my stock antenna. Amazon is sending out another and I've got 30 days to send mine back, great return policy. Thanks all for the input! And Joe, Miklor is definitely a great resource. I wish Baofeng had consulted him.

AND ...

Did you know that you can get an LDG IT-857 tuner to perfectly tune 150' of LMR 195 on 40 meters?

Couldn't for the life of me figure out why it was I could hear people, with like NO noise, but was only getting in at their noise levels on the neighbor islands!!!

Went upstairs and found that I forgot to reconnect the Duplexer after I worked on my hillbilly antenna tower.

Had on HECK of a laugh on that one.

AND ...
Did you know that you can get an LDG IT-857 tuner to perfectly tune 150' of LMR 195 on 40 meters?
Couldn't for the life of me figure out why it was I could hear people, with like NO noise, but was only getting in at their noise levels on the neighbor islands!!!
Went upstairs and found that I forgot to reconnect the Duplexer after I worked on my hillbilly antenna tower.
Had on HECK of a laugh on that one.

I'm sorry, Don, but that isn't a very good description of your problem. What is the operating system on your laptop? Which file are you actually downloading an where are you getting it? Are you receiving any error messages?

And executing (Running) the file? I know that sounds obvious, but sometimes it's the mechanic who works for hours on a car that's out of gas.

Some of the stock "ducks" are better than others. I haven't got the NA771, I decided it was too big to have poking out of my pocket, but the smaller 701 isn't very good.

Nothing to do with your aerial. The UV5 is known for low modulation, it's designed that way. There is a mod to increase it, if you fancy dismantling it and soldering some very small components, otherwise the cure is simply to make sure the "bandwidth" setting is set to "wide" and you speak fairly close to the microphone.

That sounds pretty sensible. I bet the ham community had some input to that. The last time I looked, the NJ "hands free" law didn't exempt CB. (?) That was a couple of years ago, have to check for any changes.

This is absolutely true. The name implies to me (and I am from a software/hardware development background) that it is the development pre-release version for testing and nowhere ready for release. A Beta version at best. "Stable Release" definitely means the production version to most people which one would prefer unless they wanted to take the risks associated with development testing or pre-release software.

If the Daily Build is in fact a stable software for release, then that should be it's description. Something that explains the difference between the two. I know I was scared to install it the first time, but it had features I needed.

Sent: Fri, Jan 9, 2015 3:55 pm
Subject: Re: [baofeng_uv5r] Re: Programming

I really do not want to be rude here and not helpful. So first your antivirus program might be blocking it like Norton’s does because it is not a common .exe file and has an unknown reputation. You need to allow the download.

2. I have had customers that cannot figure out how to open a DVD or even find “My Computer” to check support info we give with our radios. A few of them that have computer issues totally bricked their radios inop because they did not understand any of the programming concepts.

So my question for you is this: Do you have enough computer skills to really want Chirp installed to modify your radio? If not maybe it would be better to have a local Ham group help you with the programming and slowly learn the radio this way before jumping into full programming.

I had one customer tell me Chirp contained a virus and did something to his computer and wanted me to fix it. This was after telling everyone to use Chirp (free) if they do not want to use the factory software (free) or RT systems (not free) Most likely this person deleted system files or modified something so the computer needs a start up repair or sys restore. While in my case I am both Comptia A+ and M$ MCSE certified, which means I can fix his computer. The problem is, it will just happen again and I would be on the “hook” for free computer support along with free radio support every time an issue comes up. In my case, I do not have the time to do this and the customer does not have the skills required to use a computer let alone modifying a radio.. So you must think ahead, do you have someone or a computer store that can get your system back if a mistake is made?

I also had customers (after repeated support phone calls and on-site training) that have erased their programming, or keep asking me that they want frequencies programmed in for scanner use that are not even in the frequency range of the radio like CB radio and 6M Public Safety frequencies. One customer after repeated warnings not to do this, was dead set that they could add 800 mhz trunking frequencies to listen to on these radios. Bought

the programming cable and did something to both his radio (most likely erased the program again) and also did something to his computer and is asking for tech assist.

Be aware if you do not know what an .exe file is, most likely the programming and all the driver installation concepts will be frustrating for you. My customers I promise to give tech support to, you might not be able to find someone to do this. This group’s scope is not towards PC support issues which generally need a hands on approach for troubleshooting errors. Most likely you will need someone to do all of the installation for you. Also Ham groups might be wary if you are not licensed and putting in the wrong settings you could transmit on Police/Fire freqs disrupting some type of communications and face jail time if you are not careful.

If you are still DEAD SET on installing software, I would get local assistance for this (HAM CLUB Again)

Have them set up or give you a working .img file you can fine adjust rather than starting from scratch. You will find doing it another way frustrating for you and any slight mistake can cause other problems for you just like the examples I listed above.

The STABLE release is STABLE as far as running on your computer and for supporting the radios that it supported (as long as the remain in the same state that they were in) when it was released (April 2014(*)). For those radios, it is just as STABLE now as it was STABLE then.

The Baofeng/Pofung radios are not in the same state as they were back in April. There are now radios with BFS firmware. There are now radios with 3 power levels. There are now radios with N5R firmware. There are now radio that had their memory layout changed. There are now radios that are not BFB297 but claim to be BFB297. All of these changes have been addressed in the DAILY BUILDs since October.

(*) v0.4.1 basically v0.4.0 with a single back-ported patch that was hoped to prevent the upload of incompatible CHIRP Radio Image files into the new Baofeng radios. There are no other changes between v0.4.0 and v0.4.1. Unfortunately, the back-ported patch didn't prevent the upload of incompatible "images". So in reality, the v0.4.1 STABLE build released in October is the v0.4.0 STABLE build released in April.

Those definitions are industry wide -- and actually apply to Chirp very nearly as with any other software -- the "daily" build would be best described as a "Release Candidate" (which is generally the final or near final Beta version).

The issue that leaves confusion is that the development team apparently wants the "stable" version to be stable, not just in the sense of running correctly, but also in the sense of not having constant updates (which many people find annoying and/or discouraging). I can understand that decision, but they do need to do a better job of describing the characteristics of the various versions,

On the other hand, the "stable" release is probably the more appropriate version for most users -- just not for the people HERE. The "stable" release is fine for anyone who has a fully supported radio that itself is stable. OUR problem is that the BaoFeng radios get frequent firmware revisions (never announced, and absolutely never documented publicly) - so the daily builds are often due to the developers trying to play catch-up with the constant incompatibilities being introduced as BaoFeng keeps tinkering with the firmware of these radios. For example, if I were going to use Chirp, the stable release would work just fine for my year-old UV-5R (especially since I have the good sense to download, edit and load my own image files, instead of being too lazy to even program my own radio and needing to use some file I got elsewhere).

Look under My Computer, C drive, then programs. You may have 2 "programs" sub files to look under. Find a listing for Chirp.exe.

If CHIRP installed and didn't put a "shortcut" in the "start menu", you can use the "windows explorer" (not to be confused with "internet explorer") to go to the CHIRP folder and launch it by double-clicking on the "chirpw" file. It should be located here.

C:\Program Files (x86)\CHIRP

Another possible solution would be to download the ".ZIP" version of the file. You can extract it anywhere you like. You would also launch it by double-clicking on the "chirpw" file.

Do a search on your computer for chirpw.exe

On my windows 7 computer, it is in c:\program files (x86)\CHIRP\chirpw.exe

Once you find that, create a shortcut and put it on your desktop. That is the program to run.

Ok guys. You have covered all the crazy stuff I can't understand. But, if I want to put a 2M antenna on the chimney of my 1 story ranch about 10' up. Maybe 25' total, would a cheap copper pipe J-Pole be decent? Something like this for $42 2 Meter VHF SLIM JIM amateur ham radio J-Pole base antenna 144-148MHz I've already got a mount on my chimney and some mast from OTA TV I was doing before.
I'd be pushing it with a UV-82L or maybe a TM-281A.

Tomorrow I'm going to go pass my General test. I dunno why, except it's only $15. I'm an old CB crazy that got over CB retard chat. Just chatting on 2M is way better than CB insanity. Is the 70cm band on my Baofang good for anything? I'm asking this because I'm buying an antenna. I assume a straight up 2M antenna would be better on 2M than a dual band. What's out there on 70cm that isn't on 2M? Can I talk further? Can I reach alien life forms? Are there blind hot babes on 70cm that might find me attractive? I'm looking at this single band antenna 2 Meter VHF SLIM JIM amateur ham radio J-Pole base antenna 144-148MHz and just keep thinking it will be better on 2M than a dual band.

HEY JOE,

You should try building your own copper J-Pole. If you have just a general knowledge of soldering copper water pipe, then you can build your own!!!

I've built a few for myself and friends and they're great fun!!!

You can just google jpole antenna, and get all kinds of ways to make em.

you can message me for more info if you're interested.

That antenna is NOT for 2M/70cm ham use.

It's for slightly different bands on other services as stated in the listing – i.e. FRS,GMRS,MURS

Ham bands (i.e. UV-5R)

2M 144.00 – 147.99

70cm 420.00-450.00

FRS 462.5625-467.725

GMRS 462.55-467.725

MURS 151.82-154.60

Sot there are different antennas for these two sets.

It depends on where you are at and what amateur repeaters and simplex operations are within your range. Some areas have a lot of 2 meter and little 70cm. Other areas just the opposite. Look for a list of repeaters in your area. Also, find a local ham club and get involved with them. That may influence what band(s) you operate on.

Without going into technical differences between how the bands behave, for all practical purposes, especially if you are using relatively strong repeaters, you can consider them pretty much the same. They both offer FM communications via radio over a relatively local distance (range varies by many factors, especially your choice of antenna). Different groups of people are going to "hang out" on different repeaters. Find one that fits you and your personality, whether 2 meter or 70 cm, and that will influence your choices.

70 cm is a=just a higher freq, and it is about the same as 2 m. I use bouth vhf and uhf, uhf is better in buildings, where 2m is good for outdoors.

Well, he may be slightly overstating the case, but it does sound like you are not familiar enough with your computer and Windows 8 to do any serious troubleshooting without quite a bit of hand-holding, or, yes, it is possible to mess up a computer if you delete or move important files without realizing what you are doing.

I don't use Windows 8, so I can't tell you exactly where you need to look and what steps to take, but I'm sure we have some folks here who are familiar with Win 8 and Chirp. The only advice that I can offer is that both sides need to be patient with each other - because whoever tries to help you is going to have to be asking you questions that sound a lot like "Are you sure it is turned on" as they try to walk you through troubleshooting in very small steps to reduce the chance of messing up anything.

If you live in an area where you only will be using 2M, that antenna will do as well as most.

If you live in an area where you might also want to use the amateur 440 MHz band, then you should look for a dual band antenna. There are plenty of dual-band J-pole and Slim Jim designs available.

OK, making progress.

Now, let me explain this as gently as possible:

THERE AIN'T NO SUCH THING AS "I get an error message" -- if you are going to ask anyone about a problem with your computer and software you ALWAYS MUST include EXACTLY what the error message says.

I think you mean Ed Fong. I have both of his DBJ1 (you buy PVC yourself) and his DBJ2 flexible and they perform very will in both bands. One suggestion he doesn't make on the DBJ1 is to seal the caps. Otherwise water will seep in over time and ruin your antenna. And of course make sure you use outdoor grade 50 ohm cable and coax seal on all joints including the bulkhead fitting on the base cap if you want your rig to last more than a year.

A hint on his latest DBJ1 kit. The last batch had very soft wire attached to the top of the internal antenna and it sagged quite a bit inside the pvc shortening the length more than 2 inches which can effect performance on VHF. I put a layer of heat shrink over the wire which gave it enough stiffness to stand up properly inside the pvc. Also get the exact pvc he states in his instructions, NOT schedule 40 which is what most building supplies carry.

In most areas you are going to find that some of the repeaters are paired or linked so that the same traffic is available on both bands. There are a huge number of variables as to which will work better, but sometimes you will get out further on UHF and other times on VHF. As an example, I live in a flat urban area with mountain repeaters 30 - 50 miles away and others on the same plane as my home. Usually I get better service out of UHF on local repeaters VHF on distant repeaters. You have both, so use both. Just get dual band antennas with good reputations. Do some research as some really work on only one band and are just resonant on the other.

At least in my area, what was once exciting, interesting, and informative, the entire 2 meter band is now mostly dead. There are about 3 or 4 ex CB'ers still just a slip from saying "that's a big 10-4", but otherwise talking about how many tomatoes in the garden this week, compared to last week. I got two Baofengs last year for XMAS. I have not spoken to anyone yet on either one.

As good a reason as any

>> I'm an old CB crazy that got over CB retard chat.

you got to start somewhere

>> Just chatting on 2M is way better than CB insanity.

Opinions may vary

>> Is the 70cm band on my Baofang good for anything?

finding blind hot babes (see below)

>> I'm asking this because I'm buying an antenna. I assume a
>> straight up 2M >> antenna would be better on 2M than a dual band.

Not necessarily

>> What's out there on 70cm that isn't on 2M?

443 repeaters

>> Can I talk further?

With equal boom length beams..... yes.

>> Can I reach alien life forms?

To boldly go where no man has gone before ?

>> Are there blind hot babes on 70cm that might find me attractive?

they are blind... so possibly. The really attractive ones are found
in the twenty meter Extra class segments.

>> I'm looking at this single band antenna 2 Meter VHF SLIM JIM
>> amateur ham radio J-Pole base antenna

Not a bad antenna, but you will be limiting yourself to one band.

Today's choice of antennas will change as you experiment more with
various modes and frequencies, so whatever you chose, just consider it

a starting point.

47592. DC Power to Radio

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-10 20:06:02 UTC
From: johnhammond117@...
Topic: 47592 Message: 47592

I'm trying to use the UV-5R as an APRS transmitter in a remote solar powered station. I need to be able to power the radio from an external power source.

I see three possibilities of doing this.

1) Just drop the radio with the battery in the drop in charger. Will this damage or overheat the battery?
2) Use a battery eliminator (http://www.amazon.com/EarlyBirdSavings-Battery-Adapter-Eliminator-Baofeng/dp/B009RCQWLI).
3) The manual indicates that you can power the radio through the headset port with an adapter, but I have not been able to find one online.
http://picpaste.com/pics/pwr-aRvbYdNd.1420920077.png
http://picpaste.com/pics/pwr-aRvbYdNd.1420920077.png Does anyone know where to find one, or the pinout required to power the radio this way?

If anyone has some insight on this it would be much appreciated.

Thanks!

1. No. The charger won't be able to properly detect a charged battery if the radio is on.

2. No. Don't buy this battery eliminator.

3. No. The manual is incorrect. This voltage is used to power accessories, not charge the radio.

#2 is the way to go. But battery eliminators are supplied by many sellers and vary from junk to OK. The "junk" ones don't have adequate heat sink to handle the heat generated due to the current draw when the radio is transmitting. This one has the electronics built into the plug. I doubt the heat sink is adequate.

A lot of the battery eliminators are built from battery pack shells. The don't even bother to change the label (they still say "Li-Ion Battery"). If they are too lazy to label the device properly, I wouldn't trust them to design the device properly.

Look for a battery eliminator that is properly labeled. It should put out somewhere between 7.4v and 8.5 volts at around 3 amps. I would look for a genuine Baofeng battery eliminator. Baofeng Tech has a good one (they even put their name on it). Sure you will pay a little bit more, but it will be worth it. I've seen too many throw their money away on junk ones.

Rich,

Got a new one today to add to your famous customer comments at a hamfest or trade-show list.

A previous customer (with a General Class license) brings back a Yaesu FT-60R that we had programmed with the entire State of AZ ham repeaters (around 400). He has it in VFO mode, types in 146.940 and wants to know why he can't bring up the local mountain top repeater in the west Phoenix area - since I programmed all of the repeaters into the radio.

I patiently explained that he was in VFO or Frequency mode and that he had to switch to Memory Mode in order to access the pre-programmed memory list.

So he switches to Memory mode and tries to type in 1-4-6-9-4-0 (the radio only has 1000 memories), not 150,000.

I explained that the memories in his Yaesu FT-60R only go up to 1000, and that he has to either find the correct 146.940 repeater in his radio or turn on the Alpha Display option and turn the dial to the correct repeater.

He stops at the first 146.940 repeater he sees in memory, tries to kerchunk the repeater, and when it doesn't come back he looks very confused again.

Apparently a gluten for punishment, I ask which of the various 146.940 repeaters in the state his radio is set for, he replies with "Doesn't the radio automatically find the closest one with it's built-in GPS?"

I almost doubled over laughing.

There are several Chinese outfits all set to ship hf rigs, but the FCC will not allow wide-open 0-30 MHz transmit, so the likelihood of seeing these soon is not good.

Loads of the hot babes work 70cm SSB while piloting hot air balloons, hence the term mile-high club (grin).

I guess some of you guys missed the main points, which was the General Class license holder (who owns a Yaesu FT-60R, not a cell phone) first thought his analog HT radio had 150,000 memories, then thought the Yaesu came with a built-in GPS, and then thought the radio would automatically lock onto the nearest 146.940 repeater (none of which the radio could do, plus his ignorance of how the radio actually worked with repeaters simply stunned me - and the folks standing around the hamfest after he left). This guy didn't just get the radio, nor did we just program it for him today, he simply bought it over to complain that our previous repeater programming (from several months ago) must be wrong as he can't bring up his local repeater. You would think you would have at least read the manual in several months time.....

As for the GPS idea, Icom has already implemented that idea with the digital DStar platform and Kenwood in their APRS D72A HT, but again (primarily due to both cost and complexity) neither Icom nor Kenwood sells as many of these radios as they would like, nor will they likely anytime soon if the average ham radio operator doesn't understand how their radio works within their local repeater area.

If by reasonably priced, you mean somewhere around $500 to $600, perhaps, but again only after the company can convince the FCC that the 100w hf rigs can't easily be modified for 11 meters. Of course, considering how many Part 90 radios from China aren't Part 90, perhaps it's only a matter of time before they arrive.

TOC has "4 left":
http://threeoldcrows.com/shop/magento/ham-radio-equipment/accessories/battery-eliminator-auto-adapter-for-baofeng-uv-5r.html

I purchased two of these last year and have one in almost continuous duty.

On 01/10/2015 12:34 PM, Jim Unroe rock.unroe@... [baofeng_uv5r] wrote:

1. No. The charger won't be able to properly detect a charged battery
if the radio is on.

2. No. Don't buy this battery eliminator.

3. No. The manual is incorrect. This voltage is used to power
accessories, not charge the radio.

#2 is the way to go. But battery eliminators are supplied by many
sellers and vary from junk to OK. The "junk" ones don't have adequate
heat sink to handle the heat generated due to the current draw when
the radio is transmitting. This one has the electronics built into the
plug. I doubt the heat sink is adequate.

A lot of the battery eliminators are built from battery pack shells.
The don't even bother to change the label (they still say "Li-Ion
Battery"). If they are too lazy to label the device properly, I
wouldn't trust them to design the device properly.

Look for a battery eliminator that is properly labeled. It should put
out somewhere between 7.4v and 8.5 volts at around 3 amps. I would
look for a genuine Baofeng battery eliminator. Baofeng Tech has a good
one (they even put their name on it). Sure you will pay a little bit
more, but it will be worth it. I've seen too many throw their money
away on junk ones.

Absolutely. My first battery eliminator was from the Three Old Crows General Store. Those are also good battery eliminators. I just didn't mention TOC since they have been going out-of-business for quite some. I figured those things would have been grabbed up early.

You are letting you age show!

Obviously you remember the days when getting a ham license involved actually knowing something about electronics, propagation, FCC regulations, and "Good Amateur Practice" -- those days are long gone. We have EXTRA class operators in this group who don't have the level of knowledge that would have been expected of a Novice years ago. Memorizing the answers to questions you don't understand is NOT knowledge.

On the other hand, I would have to point out that none of the dumb things that General said really involve knowledge of amateur radio -- we are simply talking about an Appliance Operator who never read the owners manual for his appliance -- something that the majority of hams are guilty of.

The FCC's only serious concern is 26-27MHz

Programming a radio for ham bands only or for 1.8-24.990 MHz plus 28.000-29.700 MHz is simple enough in firmware. No more complicated than setting up firmware that has a radio covering 136-174 MHz and 400-520 MHz

One of the Chinese companies WILL do it -- then the S will really HTF

From: baofeng_uv5r@yahoogroups.com [mailto:baofeng_uv5r@yahoogroups.com]
There are several Chinese outfits all set to ship hf rigs, but the FCC will not allow wide-open 0-30 MHz transmit, so the likelihood of seeing these soon is not good.

#1 will work fine so far as the radio is concerned. It isn't ideal for the battery and it may overheat the charger, depending on the input voltage you provide to the charger. The voltage regulator in the charger works like any other solid state voltage regulator -- it has to reduce the excess voltage by dissipate power as heat. The BaoFeng charger is meant to run with between 10-11v input, it can handle a 12v input but that does generate more heat than intended. Somewhere around 13.5-13.8v input the charger will shut down. TYT makes a charger base that is fully compatible with the BaoFeng batteries but uses better construction and components. The TYT charger will run with up to 14v input.

#2 would work but may need some work. The battery eliminator is basically just a voltage regulator that reduces a 12v input to power the radio. SOME of these battery eliminators are poorly made and will overheat quickly, others are better made. So far as I have seen, there is no way to be 100% sure of getting a good one -- especially on Amazon due to the way Amazon handles warehouse stock for the "fulfilled by Amazon" program where stock from different sources is mixed and shipped at random. You might consider disassembling the battery eliminator and adding a heat sink.

#3 - I have never heard of this adapter actually existing. I have not examined the radio schematic, so I can't say whether or not it is possible but even if the adapter exists it will still be basically just a voltage regulator with the normal problem of dissipating enough heat for prolonged use.

For any of the options you need to have another battery that is charged by the solar panel and provides power to the radio through some sort of voltage regulator. It might be best to simply design and build your own voltage regulator with adequate heat sinking for full-time operation rather than taking chances on any device intended for occasional part-time use (especially when you consider the wide variations in quality of electronic products from China)

From: johnhammond117@... [baofeng_uv5r]

I'm trying to use the UV-5R as an APRS transmitter in a remote solar powered station. I need to be able to power the radio from an external power source.

I see three possibilities of doing this.

1) Just drop the radio with the battery in the drop in charger. Will this damage or overheat the battery?

2) Use a battery eliminator (http://www.amazon.com/EarlyBirdSavings-Battery-Adapter-Eliminator-Baofeng/dp/B009RCQWLI).

3) The manual indicates that you can power the radio through the headset port with an adapter, but I have not been able to find one online. http://picpaste.com/pics/pwr-aRvbYdNd.1420920077.png Does anyone know where to find one, or the pinout required to power the radio this way?

If anyone has some insight on this it would be much appreciated.

Thanks!

I set mine at
0 1 2 4 8 16 24 32 48 64
on both bands. Seems to work ok.

64 is really tight. It takes a full quieting strong signal to open the squelch and also make the squelch tail a little shorter and less irritating. Good for use on my echolink node in the same room but maybe not for general use.

1 is noticeably looser than the factory default but so far I haven't noticed any popping or squelch opening any more than usual, which happens occasionally around here due to being in a high RF environment and lots of cable leaks and consumer device noise.

The adjustments seem to work the same on a UV-82 with B82S25 firmware and a UV-5R with BFS311.

47627. Constantly receiving noise heard after a fall/drop on GT-3

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-11 16:54:27 UTC
From: Yuriy Kulikov
Topic: 47627 Message: 47627

Hey everyone,
I own a Baofeng GT-3 with a kit antenna (Sainsonic) which I use during skitour sessions. GT-3 is located in a backpack, keypad is locked, remote is located on my shoulder.
On several occasions I have noticed that after a particularly big drop or a fall, GT-3's starts to receive something but I can hear only noise. The acceleration is not extreme, as a fall is typically about 2-3 meters, landing on non-horizontal surface and the GT-3 itself is located in the backpack. Display does not indicate any changes compared to a normal state. Green RX LED is lit. The noise can be heard until the unit is turned off. After it is turned on again there is no reception and the GT-3 can be used normally. After the next big drop I have to power cycle the GT-3 again.
I have tried to figure this out myself, but I the only explanation I can think of are is that the battery contact is lost for a short moment.
Later on this antenna was broken after falling on the floor, just in case this can be related.
Does anyone have any ideas?
Thanks a lot in advance,
Best regards,
Yuriy

If I had a service monitor I would measure the signal strength and SINAD level at which the squelch opens and closes for each of the 64 levels. Then I would do the same thing at 10 equally spaced squelch pot positions on a few real high quality radios. That way you could possibly come up with settings that would be similar to how the squelch control behaves on a real radio. I don't know if that's what Baofeng's engineers did. I don't think they are that smart.

Tom

Xuan,

Of course various Chinese companies "could" design the hf radio to not be able to transmit from 26 through 27MHz, but they know that doing so would severely limit their sales within the U.S. market, so they have to come up with a method that appears to limit the transmit (for FCC approval) - yet make the mod simple enough to not slow down sales to the CB types.

You only have to look at the sales of the "real" Baofeng FCC Part 90 F-11 radio (no longer available due to poor sales) vs. the onslaught of UV-5R radios that transmit all over the place to see which ones the market voted for with their wallets.

Hey all,
sorry for my English, obviously I was not clear enough.
I am dropping (or jumping if you wish) from a cliff or a bump while skiing with the radio in my backpack. I cannot avoid it :-) You can get an idea in this video https://www.youtube.com/watch?v=AypzluwKSEM. It is nothing extreme, acceleration is moderate as landing is done on an inclined surface. Since none of my mates had the same issue I am guessing that mine is somehow related to the GT-3 I am using.

Hi Yuriy,

Your English was plenty clear enough for me. I just don't have an answer for you.

At first I would have thought that maybe you had a broken antenna or the antenna connector is not soldered securely on the circuit board. But because power cycling the radio removed the noise, it hardly seems that it can be a mechanical issue.

Could it be something in your backpack is rubbing the antenna and that causes a build up of static electricity? Then maybe the act of turning off the radio dissipates the static electricity? Maybe you can rearrange things in your backpack or try a different antenna.

If it was caused by forces from the "drop", then I would think that you could shake the radio in an up and down motion and cause the noise.

Is this on a VHF or UHF frequency?

Hi Jim, hi everyone,
Thanks for your replies.
Radio was configured to receive UHF. Following your suggestion I have tried to shake the radio, throw it around my flat to no success in reproducing the issue. I have felt there is a strong link with the mechanical interaction because the issue occurred on multiple occasions (at least 4), always immediately after a drop. So I tried the buttons. After some experiments I am able to reliably reproduce the issue on both my GT-3.
When radio is configured to receive UHF and keypad is locked, hold any 2 numeric keys for a couple of seconds. Greed LED lights up and I hear the noise.
I guess the buttons where pushed inside the backpack. I am considering using a hard case.

This looks like some utility combination for developers or something like that. Or maybe it is a bug in the software. Do you know something about it?
Does it also occur on the radios?
Best regards,
Yuriy

Thank you for the recommendation! I ordered the internal mic used in the Baofeng to try to transplant it into the unhappy speaker-mic, so if that doesn't work I might try the zastone. As for the Baofeng speaker-mic, any recommendations for stopping it from falling out of the speaker jack? Mine gets dislodged at the slightest cable disturbance.

Thanks,
John KK6NQK

Hi Yuriy,

I've tried this on my newest BF-F8HP and UV-82 and I am unable to duplicate this. It is possible that I am not doing this in the same way that you are.

I am locking the keypad by pressing and holding the [#] for 2 seconds. Then I am pressing and holding 2 numeric keys chosen at random and holding them for much longer than 2 seconds. Nothing happens except for the "beep" indicating that the keypad is locked.

I believe that you said that you have a BF-F8. Would you let me know what the firmware version is?

I initially used a Kenwood SMC-34 and got many reports of low volume, even if I held it close to my mouth. Then I bought a Baofeng/Pofung speaker mic from Amazon. I thought that was doing pretty well but I've also been told it sounds like I have a sock over my mic, muffled sounding, and excessive bass. I removed a bunch of foam and various pieces of plastic, etc. from in front of the mic inside the Kenwood unit and people now prefer that Kenwood over the Baofeng. However, I always have to turn the volume very far up to hear everything when I'm outside, something that I don't have to do with the Pofung mic.

BTW, my Pofung also could fit better in the radio's jack. It doesn't fit tightly and snap in like the Kenwood.

How's the volume and audio on the Zastone? Anyone ever compared it to the Baofeng/Pofung? I'd be willing to try it if it did the trick, i.e, volume was good, transmitted audio was good, and the plug and jack were a good match.

This is the mic I use.

http://www.radioddity.com/us/original-baofeng-dual-ptt-speaker-for-gt-5-uv-82-series.html
http://www.radioddity.com/us/original-baofeng-dual-ptt-speaker-for-gt-5-uv-82-series.html

You can usually find this mic cheaper other places than Radioddity. I think the cheapest was Amazon

LOVE the small size and LOUD volume. I get good signal reports also. The key has been to talk INTO THE MIC not the SPEAKER... (A common mistake I see a lot of guys doing).

BUT this Mic has a caveat. If you want to use it on a UV-5R or similiar radio that does not have a dual PTT, you need to solder two of the wires together. Super easy, and takes one drop of solder on the board. I can post a picture if you're interested. Took me all of 10 min from time of sitting down with the mic, to plugging it back into the radio to check it. It will work without the mod, but only if you press one side of the trigger.

I've had this mic exposed in the rain all day during the Honolulu Marathon, and it continued to work with no problems. And yes, it did get wet with rain.

The Wouxun mic is a great little speaker mic also, and needs no mods, but it pushes the 20.00 mark.

73
James
W8JVF

P.S. As I was typing this, one of our club members was lamenting over the repeater about his speaker mic woes. Turns out that everything on the mic was good, except for the little hole for sound to pass through to the actual microphone. So he drilled it out with a small drill bit and now it works beautifully.

47645. Can't Download Firmware, Buttons Not Working

From: wayfarer123@...
Topic: 47645 Message: 47645

Thank you for your input in my other thread. Amazon has sent a replacement radio and this one, as far as I can tell so far, works great. I've hit a couple of 2m and 70cm repeaters from my house. I'll be sending the other radio back but I'm going to try to get ahold of a wattmeter before then.

I am having some issues with another radio though. A coworker asked me to program his UV-5R (not A). The first thing I noticed about this radio is that I can't switch into frequency mode (I thought my coworker did this at work on Friday, but memory could have failed me) - all I get is a beep. I also can't open the menu, just a beep.The lock is not on. Finally, CHIRP throws a "Radio did not respond" error when I try to read the firmware. I thought, okay, I'll get a recovery firmware. Turning on and holding 3 gives

Ver
USA349

I found that this equates to BFB307 and got the firmware
http://kc9hi.dyndns.org/uv5r/programming/CHIRPrecovery/
http://kc9hi.dyndns.org/uv5r/programming/CHIRPrecovery/ The radio appears to have programmed okay. All of the channels are there but I am experiencing all of the same issues.

I really only have one theory, my coworker did have someone else program this radio for him previously. Perhaps he used his UV-5R image without attention to firmware version. If that's the case, I don't know how I would find the proper firmware version for this radio. But, as I said, I thought the modes were switching before and its odd that it would partially work, so my theory may be wrong.

Any thoughts?

Hi all

I use the stock standard earpiece and inline mic with my UV5R and am constantly being told that I'm quiet, even with a good signal.
Is this a common issue with the radio or do I just need a better microphone? If so could you please recommend one. I prefer an earpiece as I am often in noisy environments and on public transport.

Have you tested your radio without the ear piece to verify the radio has good modulation? I was one of the unlucky recipients of one of the radio's that the factory switched around R69 and R70 which causes very low modulation. I had to practically scream into it to get people to hear me. If you haven't tested it without the ear piece do so. If your loud enough then it suggests that the factory ear piece is the issue. If your still low the problem is most likely the radio. Here's a link to the files section that explains the low modulation issue and how to fix it. If that's the problem I hope your good with SMD

https://groups.yahoo.com/neo/groups/baofeng_uv5r/files/Low%20modulation%20fix%20for%20UV-5R%20and%20UV-82L%20%28DG2IAQ%29/ https://groups.yahoo.com/neo/groups/baofeng_uv5r/files/Low%20modulation%20fix%20for%20UV-5R%20and%20UV-82L%20%28DG2IAQ%29/

47651. S-meter readings

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-12 07:49:27 UTC
From: kb9vxq@...
Topic: 47651 Message: 47651

I realize S-meters aren't always accurate but on my UV-5RA even the slightest signal that's barely audial through the static shows full scale on the s-meter. Basically anything that opens the squelch on a low setting will show full scale. There are times that a s-meter that's somewhat accurate is nice to have, such as when testing an antenna or the sort. Does anyone else have this problem?

Tnx, Tracy

From: Jim Unroe
Topic: 47645 Message: 47654

Based on the firmware version, USA349, your friend owns an F-11, not a UV-5R.

http://www.wouxun.us/category.php?category_id=60

The F-11 has its own model selection in CHIRP. Only this selection sends the correct "command" to the radio to initiate cloning. The radio will ignore anything else and so the "Radio did not respond" error would be normal (and expected) if you didn't choose F-11.

The F-11 was the first Baofeng radio to have the ability to disable toggling between MR (channel) and VFO (frequency) modes to be "more" FCC Part 90 compliant. They came for the factory with the VFO/MR button disabled. It appears that this radio has VFO/MR switching disabled. The only way that this can be altered is by using software. CHIRP has the ability to do this.

The UV-5R (and its plethora of variants including the F-11), all have settings that can disable access to the RESET menu and all menus. These settings work as expected when the radio is in MR mode, preventing the user access to the RESET menu and/or all menus based on which of the 2 settings has been enabled. When the radio is in VFO mode, all menus will function no matter if they have been disabled or not. This is another reason to disable VFO/MR switching.

So, based on your description, your friends radio has VFO/MR switching disabled and, at the very least, access to the menus disabled.

The firmware in these radios is not upgradable. You are not downloading or uploading the firmware from these radios. What you are doing with CHIRP is downloading an image of the state of the radio's memory. You then alter this image with CHIRP and eventually upload the changes back to the radio's memory. The layout of memory in these radios can be different from one firmware version to another. Uploading an "image" to a radio that has a different firmware version than the radio it is being uploaded to can cause undesirable behavior. For this reason, it is becoming more and more important that these memory images be kept separate based on the firmware version of the radio that they were downloaded from.

Once you download from your friends radio using the F-11 model, you will see that the "real" firmware version is USA307. There is a USA307 "reset" image at the link you mentioned. I doubt that you will need it.

You will not be able to directly upload your channels and settings directly into your friends radio. What you can do is load your friends image into one tab of CHIRP and your image into another tab at the

same time. This will allow you to copy-and-paste the channels between tabs.

A method that I prefer over the above is to "import" the master image. Importing does a more thorough job of transferring channel data between radio images. With your friends image loaded into a CHIRP tab, you would select "File" -> "Import". Then click the triangle and change the file mask to "CHIRP Radio Images (*.img)". Now you can select the image file from your radio and import it into the tab of your friends radio. Adjust any other settings and then upload to your friends radio. Don't forget to save a copy to a file in case you want to do some more editing later.

There is no "S-meter" on the UV-5R and variants. This indicator is the same as the LED on the front of the radio that indicates that something is being received. It is either ON or OFF.

Very good presentation. Better graphics than the propagation basic file.
The block setup for individual scenario's was a good idea. Maybe a similar
setup would be good to explain gain. Visuals seem to help.

Good job guys.

Just as the default squelch settings were almost the same... I find that the VOX is similar. Does anyone else have this same feeling? And could it possibly be corrected similar to the Squelch solution in Chirp?

For anyone else, I've managed to improve the situation a bit by changing a few settings.

I updated the squelch from the default 3 to 5.
I turned off the voice
I turned off key beeps
I changed the VFO bandwidth from Wide to Narrow

Hey there John!

Look in the photos section. There is actually a nice pinout picture for the BaoFeng. It's identical for the Kenwood. And yes, if you're using FLDigi it works. I've done it, but I use a URI between the radio and the computer.

Just use CATV coax. Don't use the differentimpedances. 75 ohms is only a 1.5 SWR.I've used RG-6 before and it works fine.
It also has less loss at VHF and UHF then
RG8X does. You can get F to PL-259 adapters. ==
Have scanners, do listen.

Do NOT get a cable that is not designed for ham radio. What you have there is a receive only cable and besides being a mismatch is unlikely to handle any power since it is designed for eceive only.
Try a Comet CTC-50 available several places like universal-radio
http://www.universal-radio.com/catalog/antsup/2750.html
Ir's good for 60W VHF and 40W UHF
Or a Diamond MGC50 -- available several places like Gigaparts:It is limited to 40W VHF and 30W UHF.

They cannot fix anything for existing radios, because the firmware cannot be updated (and hardware changes would be needed to change the indicator into an s-meter)

They cannot fix the s-meter without AT LEAST replacing the physical display, and probably replacing the display driver chip, as well as expanding the firmware to support the additional code. That isn't likely to happen on a radio that basically sells entirely on price.

From: Michael Black
Topic: 47666 Message: 47682

Before you say that read the specs…it's got 20dB return loss. Not important for a receive-only system which only relies on SNR (i.e. reducing both signal and noise linearly makes no difference).

http://www.hollandelectronics.com/catalog/upload_file/144823.pdf

That means your 5W becomes 0.05W and your cable (some part of it) becomes a 4.95W heater.

So, like I said, do NOT use a cable that isn't explicitly designed and rated for transmitting the frequencies you want.

Mike W9MDB

That flat cable should be able to

handle just an HT.

==
Have scanners, do listen.

From: "Black Michael mdblack98@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com>

Do NOT get a cable that is not designed for ham radio. What you have there is a receive only cable and besides being a mismatch is unlikely to handle any power since it is designed for eceive only.

Try a Comet CTC-50 available several places like universal-radio

http://www.universal-radio.com/catalog/antsup/2750.html

Ir's good for 60W VHF and 40W UHF

Or a Diamond MGC50 -- available several places like Gigaparts:

It is limited to 40W VHF and 30W UHF.

http://www.gigaparts.com/Product-Lines/SO-239/Diamond-Antenna-MGC50.html

The extra adapters plus the jumper cable won't do anything good for your signal, but the aren't going to do so much harm that it cancels out the advantage of the J-pole and the extra height.

On the other hand, you can eliminate the extra adapters and the jumper (along with both the losses and the cost of all that) by running the RG8X out the window sandwiched between two layers of the 1x1 foam insulation usually used around window air conditioners.

Sorry, Scott, but you missed the whole point of the original question -- his problem is to get the cable from inside to outside without drilling a hole. The mismatched cable you suggest is no thinner than the cable he has.

Just use CATV coax. Don't use the different
impedances. 75 ohms is only a 1.5 SWR.
I've used RG-6 before and it works fine.

It also has less loss at VHF and UHF then

RG8X does. You can get F to PL-259 adapters.

Along with the final method used to get from the inside to the outside, you must consider your lightning protection. Don't know how high your "J"pole is going to be, but if high enough, it will eventually invite in the worst house guest you could ever find, a lightning strike. It's ALWAYS best to keep him outside your door. Send him to ground before he gets inside.

I'll not drag out all the stuff that should be done and start another on-line argument on what's best, just Google lightning protection and there's a ton of stuff to see.
Also lookup PolyPhaser, they wrote the book and have many white papers on the subject at their website.

Maybe the next-gen radio chip might incorporate a real S-meter. It's not the display that's the problem.

And why would they reduce their margins at all? Would more people buy it with a working S-meter? I doubt it.

Cheap, good, or fast. Pick any two J

Simple observation at shows will tell you that the vast majority of cheap Chinese radios are not purchased by hams (at least not in the beginning, although they may become hams later).

On my UV-5R and UV-82 I have found that:
1. The squelch remains closed with the level set to 1 and stays open when set to 0.
2. The change in values in small increments (like less than 10) is not noticeable.

I believe if you want the setting spaced out evenly they should be:

0 0
1 1
2 8
3 16
4 24
5 32
6 40
7 48
8 56
9 64

that way at least menu settings 3-5 are approximately in the range of what the default factory values are, which appears to vary in different models.

Tom

I haven't tried that. I'll have to set mine backwards (0=64...9=0) and see what happens. Maybe there is a firmware or microprocessor setting so that 0 is open no matter what value is set in that position.

Tom,

> I find that a value higher than 0 has no affect for Squelch 1

This should have been "Squelch 0"

Yep. Menu position 0 ignores the value that is set and makes the squelch stay constantly open, even if it is set at 64. Changing 1 to 56 makes it tight and changing 9 to 0 makes it loose but not open.

Oh, and that is another reason that I went ahead and allowed setting of Squelch 0 - Squelch 9 to the values of 0 - 64. I have a very limited array of radio here to test with. I expect the behavior will be different across the various models and firmware versions. This way the user can adjust to values that are the most useful to them.

Just ran pretty much the same test with the same conclusion.
Position 0 is always open regardless of number.
0 has no impact on positions 1-9.

I should have stated that I did this on a UV-82 with B82S25 firmware.
Also in menu positions 1-9 I can't tell if there is a difference between
values 0 and 1.

OK thanks for all the replies.

After using the radio with the Nagoya for a little while now I am starting to appreciate it more. It lets me get into my local repeaters. The furthest repeater that I've had success with so far was 10 miles away. Haven't really tried anything further. I've mostly been doing lots of listening.

I picked up an arrow j-pole antenna yesterday. Will give that a try soon. Hoping tomorrow I can try it out.

Next antenna I will buy will be an arrow 146/437 yagi. Just trying to decide if I want the duplexer. Anyone here find the duplexer model more convenient? Is it worth the extra money?

Also picked up another UV-5R for $25 today. It was still in the box. Could not pass it up. It has 128 memory channels compared to 117 of my other UV-5R. Must be different firmware or something.

All UV-5R's have 128 memories. You have to modify the maximum memory to range in CHIRP to put in 128 viewable channels (CHIRP understands "empty" channels so won't show them).

As for the duplexer…if you are planning on doing satellite communication you need it as the uplink/downlink frequencies are generally VHF/UHF respectively so you need both bands active. If you're not doing satellite comm you probably don't need it as you can just switch to whatever band you want to work.

The more you switch VHF/UHF the more you'll want the duplexer.

While the UV5R does have a pretty sensitive receiver, these rigs are NOT renowned for their selectivity. Even when using the HT antenna, the 'barn door' receiver does not perform well in the presence of strong, off-frequency signals. Connecting the radio to a higher-gain, external antenna might not be a good idea - especially if you live in a medium-to-high RF area. Connecting to a yagi (with even higher gain) could make the receiver almost unusable due to front-end overload. If you're intent on doing this, I would suggest borrowing a yagi antenna from a fellow ham and try it out before you buy one.

That subject aside, I'm curious why you would want a portable yagi. Unless you're working satellites or mountain-top DX, I don't really see the application. But, on the other hand, experimentation is what ham radio is all about.

James, if you ever get confused you can always check the web archive for the group.

There is a link on the foot of each message that takes you back into the Yahoo Groups page where you joined this group and to the message page...

sign in, and you can then follow the entire thread. It is a fantastic facility - we are so lucky to have it!

Thank you all. I got the idea. No cheap way out. The only proper solution is the $50 SO239 baluns with the parallel pair in between. And lightening (though VERY rare here) is always a consideration. I already have a SO239/PL259 lightning arrestor insert which goes right under the antenna and grounds to an in earth 6 foot copper rod.

Thanks

My primary reason for getting it would be for satellites. Also if I could make it work with my RC planes as a transmitter antenna.... that would be cool. I don't do SOTA but there are places in my commutes that are higher elevation.

I also plan to get a Yaesu ft-60r and that would be my primary radio to use with the yagi.

Rich,

Interesting looking radio. Some info shows it as ip57, while other info shows ip67 (not that it will matter much to the $50 is too much money radio crowd). At least they finally got the Zero in the correct place on the keypad. You'll have to let us know what programming style cable ends up working on it.

Craig

I guess I still don't know how to use Yahoo Groups. I am used to standard blogs where each topic is a thread and they are all in sequential order. Easy peasy... I hit the reply button inside the specific message I am replying to so it should be captured and quoted and show up right under it, but it doesn't work.

Is this not the proper way to reply to a single message?

Look for a box to click under 'tools' or 'settings' in your email program that asks if you want to include all or part of the message you are replying to.

Grounds ... what? The coax conductor or the shielding? You can't ground both and still have a functioning antenna, so it's probably just grounding the coax braided shielding.

You'll be very surprised to find that any lightning strike will energize not only the grounded link but the conductor as well. Anybody who's lived through such events eventually learns to disconnect the feed line when electrical storm activity is forecast. 20K+ amps is nothing to take chances with.

Yahoo Groups is/are badly broken with their new "neo" web interface. Most people choose email instead of web and delete after reading each message to avoid the insane clutter, so not quoting the portion of any message that one is replying to has the appearance of "random thoughts." Many follow numerous groups so such un-contextual responses become meaningless.

In email, one simply highlights the portion of the message that one is addressing before selecting "reply", and the world becomes more understandable to everyone, and better as a result.

Inline lightning arrestors are a male/female coupler which have a terminal screw on the outside which is shield. That is where you connect your earth ground wire. You screw it onto the feedline terminal of your antenna and then the feedline cable to it. Obviously the center conductor is allowed to "float" through the arrestor or it would just be a dead load. By by radio transmitter.

And yes any lightning strike which came a mile or more through the air is going to jump from the shield to the core and zap anything on or near your feedline. It's really only going to help in highly charged air surrounding a strike, bleeding off a strong charge, not a direct strike.

Those "arrestors", back in the Sixties (no, not 1860), at first were simply a spark gap within the device, intended to limit the amount of energy between – and this is the big thing, BETWEEN – the shield and the center conductor. Along with any strike current flowing down the shield and through the radio's chassis to the safety grounding conductor, that differential voltage will destroy the devices at the radio's receiver input, so they tried to limit the amount of energy there.

If you take a walk over the to the PolyPhaser website, in their white papers, they show how a piece of co-ax, shorted together at the antenna end and struck by a jolt will in fact show two pulses at the radio end, one up the other down, both with sufficient energy to do damage. This is caused by the co-ax's propagation delay.

"But, my co-ax is not shorted at the antenna end", you say... well, take a look at your connections to that "J"pole antenna. The co-ax is tied in two places to the same piece of copper pipe... kinda looks like a short to me. However, antennas are interesting beasts and at the frequency that the antenna is cut for, the cable is not really shorted, just at all other lower frequencies... like those involved in lightning strikes.

So, the lightning arrestor SHOULD be installed right where the co-ax enters the shack and tied to ground THERE. And yes, it will not shunt ALL of the strike to ground, but it does lower the value so less is left over to warrant a call to the fire department.

And, hey, I didn't just dream this stuff up, I'm just a messenger.

Oh, BTW, unless you religiously ONLY connect your antenna when you are home and intend to use it, it will eventually be forgotten... we do things like that from time to time, that's why words like "forgive me" exist. Also, there are records of lightning strikes happening ten plus miles away from the storm, and you do not need to take a direct strike to suffer damage. Antennas do a fantastic job of converting the electromagnetic energy of a NEAR strike into signal voltages... that's what antennas do... which will come down the cable for a visit... a very nasty visit.

I have a string of low voltage lighting around my house. Just about the end of the cable was a light fixture that took a direct hit. The fixture was in a crushed rock driveway. It created a crater about 3 feet. It blew apart the transformer at the other end. In between? All the other light fixtures, the bulbs were still good.

47744. channel focus

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-16 04:41:46 UTC
From: Christopher Tenney
Topic: 47744 Message: 47744

I was recently the HAM operator at our county's Emergency Operations Center (EOC) for a disaster drill. The problem I was having with my UV-5R+ was that the A and B channel focus kept changing when someone would call. How do I keep it set to a specifically A or B but be able to manually change it when needed.

Thanks,

Christopher Tenney KB3ZLH

That's a shame :-(

I have a teamup uv8 version of the uv5r which is kind of like the tyt uvf8d in a uv5r case
The teamup uv8 software allows adjustment of mic gain, upper and lower band limits, and vox thresholds, etc.

Having mic gain software control is very useful as turning up from the factory default of around 200 to the max of 255 solves any low mic gain problem

Actually that's a simple one.

Menu 7 (TDR)
Set that to (OFF)

TDR is supposed to stand for Dual Watch...

Now, you only monitor one channel at a time, then all you have to do is hit the A/B key to change channels. The little triangle to the left will tell you which channel you are on.

There is also an option that gives priority in dual watch and returns to the specified channel after reception. This is to prevent accidental broadcast on the wrong channel.
Not near my radio just now, but look at the site for "priority" option

I believe TDR actually stands for Twin Dual Receive, but most folks refer to it as Dual Watch.

47749. Re: [baofeng_uv5r] channel focus

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-16 11:05:13 UTC
From: Jim Unroe
Topic: 47744 Message: 47749

Hi Christopher,

Unfortunately, the answer is "that depends".

Originally radios would obtain focus on the last signal received if menu 7 (TDR) was ON and menu 34 (TDR-AB) was set to OFF. The user could have focus forced to the top (A) or bottom (B) by setting TDR-AB to A or B.

In newer radios, the TDR-AB behavior has been, shall I say, evolving. The focus no longer changes to the display with the most recent signal reception. The TDR-AB setting automatically tracks the display that is selected when the user uses the {A/B] key. An in some radios, the OFF selection has been removed from TDR-AB. In other words, the TDR-AB functionality has more or less been disabled. [I can see this change for radios with dual [PTT] buttons but I see no reason for it to spill over into radios with a single [PTT] button.]

I hope this helps.

Jim KC9HI

From: Christopher Tenney
Topic: 47744 Message: 47751

I just tried and I can only listen to one channel at a time. So that won't work for me. Is there another way to keep one channel from stealing focus from the other?

Thanks,
Christopher Tenney KB3ZLH

Menu 37. Off returns to the last used channel and on returns to the selected channel.

I believe TDR actually stands for Twin Dual Receive, but most folks refer
to it as Dual Watch.

You are asking for technical help in committing a crime in the US. Both of you should get amateur radio licenses and do things legally, then no problem.

On a radio not certified for MURS it is, but the FCC does not usually bother with a criminal prosecution, they use administrative forfeiture of upto $10K, and guess what no jury and if you want a hearing before a FCC bureaucrat one has to travel to DC

Do you have any FCC License?

uv5r is only transmittable on Ham freqs in the US--and then only if one has at least a Tech License. On the freqs it transmits Hams dont need certified gear--they can make their own. One can use the uv5r to receive anything that can be received on it.

Apparently you know nothing about using this radio legally. You either need an amateur radio license to use 144-148 and 420-450mhz, or need to be affiliated with a business with a license, or a public safety agency that is also licensed, and that will allow you to use the radio under THEIR license.

Please do not ask for help in breaking the law.

Were not going to help in this instance. Try something legal and it would make a difference. Read the FAQs and learn something.

I have heard some baofeng rigs are certified under Part 90 Land Mobile. I dont know of any which have been certified for Public Safety Band use. Last I knew only Hams were allowed to "home brew" and use gear that is not certified.

I have heard some baofeng rigs are certified under Part 90 Land Mobile. I dont know of any which have been certified for Public Safety Band use. Last I knew only Hams were allowed to "home brew" and use gear that is not certified.

Public safety licensing is covered under Part 90. However the Baofeng is NOT Part 90 compliant unless (a) it has the FCC ID number as part of the manufacturers label AND (b) the VFO capability has been disabled. I have yet to see a Baofeng that actually meets the Part 90 requirements.

Public safety is Part 90 and the Part 90 Baofengs are legal to use there with licensed public safety agencies and with permission of those agencies. You would have to be part of the police or fire dept, etc, and have their permission to use a private radio. Some depts only permit agency radios to be used. Land mobile covers public safety and business use under Part 90, and those radios must be certificated for such use. MURS, CB, FRS and GMRS must use Part 95 radios, and the Baofengs and Wouxuns, etc are not legal to use there. Air and marine band have their own rules to follow with what radios can and cannot be used.

Ham can use almost anything, including the Part 90 radios. Most Part 90 radios are difficult to use on ham because of how hard they are to program. One of the benefits to having a ham radio license is increased freedom to program your radios over the full 2m/440 bands without needing to be licensed to just a few channels.

When I change Menu 37 to A or B, it will NOT let me select the other channel. It is locked. Turning off TDR only lets me monitor one channel. I don’t think this radio will let me monitor A and B but keep it on A regardless of activity. Then let me switch to B when needed.

Any other thoughts?

Thanks,

Christopher Tenney KB3ZLH

The UV-5R may not be "compliant"but it is certified so compliance is irrelevant. All you need is the sticker so you can show any FCC inspector should you be asked. The fact that the FCC certified it incorrectly is their problem. They could pull the cert but I don't think they've ever done that. Mike W9MDB Sent on a Virgin Mobile Samsung Galaxy S® III

They've done it before. Midland got an frs mobile through...an ht with a removable mobile antenna. FCC realized their error and revoked approval...

Then... Get this... They approved A Uniden and some other companies frs/gmrs radios.... Ok... But they discovered after the fact that they included inversion scramblers, which was against regs. They then pulled the authorization AND fined those companies for marketing noncompliant equipment!

They appealed, stating the FCC approved them. If there were issues the grant request should have been denied. The FCC denied the appeal.

So, it can happen. The OET clerks who get the lab results evidently can let stuff slip by.

Speaking of near misses... they are far more likely than a direct hit and happen quite often which is why we use the aristors inline with our coaxs. to bleed off the surges and not fry our hard earned equipment.

I have a string of low voltage lighting around my house. Just about the end of the cable was a light fixture that took a direct hit. The fixture was in a crushed rock driveway. It created a crater about 3 feet. It blew apart the transformer at the other end. In between? All the other light fixtures, the bulbs were still good.

Needed

Inline lightning arrestors are a male/female coupler which have a terminal screw on the outside which is shield. That is where you connect your earth ground wire. You screw it onto the feedline terminal of your antenna and then the feedline cable to it. Obviously the center conductor is allowed to "float" through the arrestor or it would just be a dead load. By by radio transmitter.

And yes any lightning strike which
came a mile or more through the air is going to jump from the shield to the core and zap anything on or near your feedline. It's really only going to help in highly charged air surrounding a strike, bleeding off a strong charge, not a direct strike.

No, compliance is not irrelevant. You (the licensee) need both certification and compliance according to Part 90.

However, I also agree this isn't something the FCC appears to be at all concerned about as far as enforcement is concerned (sadly).

47780. UV-82C problem

From: romoshka@...
Topic: 47780 Message: 47780

Hello all,

Newly licensed technician here. Having trouble with a UV-82C. Per packaging it states the VFO mode is locked out in compliance with FCC. Manual says to switch between freq (VFO - yes?) and channel mode one turns off the radio, presses and holds the menu button and turns the radio back on. Problem is the radio opens in freg mode every time and I can not get it to switch to channel mode. Miklor page on UV-82C has a file: "UV-82C Programming Software (.exe)" but when trying to run it I get an error msg: "MSCOMM32.OCX or one of its dependencies not correctly registered; a file is missing or invalid"

If the radio is VFO locked out shouldn't it only open/operate on channel mode? I'm school trained in welding, machining, brewing and do orthopaedic surgery to support those activities and my lil farm but programming blows my mind. however I have successfully used CHIRP to program repeaters channels into my new BF-8HP

This is not my radio - it belongs to my boss who is not licensed yet but moving in that direction. He let me use it while I awaited the arrival of my BF-8HP which has arrived and works quite well. I now feel obligated to get this radio operating correctly.

HIi John and thanks for the response/help.

Actually I'm not using a MAC - its an XP machine so I assumed an .exe file should run fine.

And Ive downloaded the UV-82C .img file but its on my desktop and I don't see how to get it into CHIRP. I tried File-Import but that failed. Tried File-Load Module but the only extension option was a python file.

However I did find a toggle in advanced menu for VFO/Chan and I can now switch between.

Again, thanks
Steve

You can only listen to 1 channel at a time. You can thinks of "dual watch" as a 2 channel scanner.

Like I said previously, it will depend on the firmware version of your radio. On older radios, you can set TDR to ON and TDR-AB to A or B and focus will stay with whatever was selected by TDR-AB.

On newer radios, focus won't change due to a received channel on the non-selected display.

Since you obviously do not have ANY sort of radio license, the simple answer is that it is illegal for you to transmit on any frequency with any BaoFeng radio. None of these radios are legal on any frequency that doesn't require a license. While the FCC might not bother catching you if no one complains, playing around on a fire frequency will get you put in jail.

Tim,

There is NO certification for "Land Mobile" and NO certification "Public Safety Band" -- what you call "Land Mobile" and what you call "Public Safety Band" are both subject to the same regulations under the same rules, and with the same certification. Those rules are Part 90 of the FCC Rules and Regulations, also know as Part 90 of Title 47 of the Code of Federal Regulations (47 CFR 90)

From: mailto:baofeng_uv5r@yahoogroups.com

I have heard some baofeng rigs are certified under Part 90 Land Mobile. I dont know of any which have been certified for Public Safety Band use. Last I knew only Hams were allowed to "home brew" and use gear that is not certified.

According to the FCC, an unmodified BaoFeng UV-5R with the proper label IS compliant -- despite the fact that it does not conform to the rule against field programmability.

Apparently the FCC has been taking doubletalk lessons from the BATFE (or maybe it is the other way around since I think the FCC has been doing it even longer)

From: mailto:baofeng_uv5r@yahoogroups.com

Public safety licensing is covered under Part 90. However the Baofeng is NOT Part 90 compliant unless (a) it has the FCC ID number as part of the manufacturers label AND (b) the VFO capability has been disabled. I have yet to see a Baofeng that actually meets the Part 90 requirements.

If you buy a UV-5R from a dealer outside the US, it won't have the US-specific label, it will normally have the domestic Chinese label (which oddly enough is printed in English); if you buy a UV-5R from a dealer who gets his stock directly from BaoFeng it will have the proper label. The reason is simple: BaoFeng puts the US labels on radios built for export to the US.

Exactly how the TDR-AB menu works depends on the firmware version on your specific radio. BaoFeng has changed how TDR-AB works at least once, possibly more often.

The answer is simple. You have three choices:

1. Buy a radio that does what you want

2. Leave TDR turned on; leave TDR-AB set to OFF; and learn to look at your radio to see which channel is active before transmitting.

3. Leave TDR turned on; leave TDR-AB set to your preferred channel for normal operation. When you decide to transmit on the 'other' frequency change the channel before you transmit.

From: mailto:baofeng_uv5r@yahoogroups.com
Sent: Friday, January 16, 2015 10:25 AM
To: baofeng_uv5r@yahoogroups.com
Subject: RE: [baofeng_uv5r] Re: channel focus

When I change Menu 37 to A or B, it will NOT let me select the other channel. It is locked. Turning off TDR only lets me monitor one channel. I don’t think this radio will let me monitor A and B but keep it on A regardless of activity. Then let me switch to B when needed.

Any other thoughts?

Thanks,

Christopher Tenney KB3ZLH

> Programming Software (.exe)" but when trying to run it I get an error msg:
> "MSCOMM32.OCX or one of its dependencies not correctly registered; a file is
> missing or invalid"

Actually the feature that the UV-82C has does not lock out the VFO. It
actually locks out switching between MR mode and VFO mode (either
direction). So it is entirely possible to be "stuck" in VFO mode.

It appears that you are trying to use the OEM software and on another
post the operating system being used is Windows XP. The problem that
you are having is the the software on the Miklor website for the UV-82
and UV-82C is the single executable file without any of the support
files. So if you don't have the support file installed from something
else, the file cannot execute.

What you need to do is install the software for the UV-5R to install
all of the support files. Then you will be able to execute the file
for the UV-82C.

> mind. however I have successfully used CHIRP to program repeaters channels
> into my new BF-8HP

Like I said, the VFO doesn't really get locked out. It is MR/VFO
switching gets locked out. If you are in MR mode when switching is
locked out, then the radio will be stuck in MR mode. If you are in VFO
mode when switching is locked out, then the radio will be stuck in VFO
mode.

You can also use CHIRP to enable the ability to switch between VFO and
MR mode. The setting that need to be enabled is on the Settings ->
Advanced Settings page (VFO/MR Switching (UV-82C only)).

That's true enough, but the reality is that on FM Phone the distinction between S7 and S9 is generally meaningless. Readability is the only useful criterion, RF strength is generally unimportant, especially when it is masked by the nearly universal use of repeaters.

Even 'old school' analog S-meters lack both the calibration and accuracy to be really useful as a test instrument (such as for comparing antennas in a repeatable fashion).

From: mailto:baofeng_uv5r@yahoogroups.com
I'm pretty old school myself, nevertheless deciphering the difference between a S-7 and a S-9 (such as could happen when comparing 2 different antenna) wouldn't be easy even if you had bionic ears. That was my main reason for asking

Subject: Re: [baofeng_uv5r] PTT

No, compliance is not irrelevant. You (the licensee) need both certification and compliance according to Part 90.

However, I also agree this isn't something the FCC appears to be at all concerned about as far as enforcement is concerned (sadly).

47798. RE: [baofeng_uv5r] PTT

Topic: 47753 Message: 47798

That is what I am saying. I will also say Part 90 is long and complex, and like any long and complex document is certainly subject to some amount of interpretation. The only important interpretation is what the FCC says. However, it is not uncommon for two people to ask two different FCC sources the same question and get different answers. So the bottom line is, as a license holder, I choose the more stringent interpretation to protect my license. Anyone wishing to use any radio on a Part 90 licensed system MUST have the permission of the license holder. Any license holder should consider all aspects of such a request before granting permission. That also includes the fact that a Part 90 license specifically states how many individual radios are covered by that license, and if they already have that many, they can't add more without modifying the license. So many unique considerations that relate to using a radio under a Part 90 license authorization.

Here is the actual text on field programming:
"(e) … transmitters designed to operate above 25 MHz shall not be certificated for use under this part if the operator can program and transmit on frequencies, other than those programmed by the manufacturer, service or maintenance personnel, using the equipment's external operation controls."

However, there are about 3 pages of information surrounding this quoted paragraph, and I would suggest anyone truly interested to read it all in context.

As to the ID number, here is the applicable rule:
"§2.925 Identification of equipment.
(a) Each equipment covered in an application for equipment authorization shall bear a nameplate or label listing the following:
(1) FCC Identifier consisting of the two elements in the exact order specified in §2.926. The FCC Identifier shall be preceded by the term FCC ID in capital letters on a single line, and shall be of a type size large enough to be legible without the aid of magnification."

But again, this is an excerpt from roughly 3 pages of the FCC rules, so please read it all in context, then bring in the lawyers that specialize in FCC regulations to explain it in plain English.

And, as I indicated before, in absence of something that draws their attention to you, the FCC isn't running around looking for excuses to enforce most of these rules. Even when they find an issue, they typically offer a warning first and only pursue more serious recourse if you don't respond promptly and thoroughly to the warning. But... they don't have to do it that way.

Disclaimer: I am only expressing my opinion. I urge anyone who needs a precise or defined legal answer to these questions to seek applicable legal advice.

47799. Re: [baofeng_uv5r] TYT FH-8

That IS what he said, but the FCC seems unwilling to say yes or no in writing. On the phone several months ago I got one guy who said he could not discuss any specific radio models but that an operator could use properly certified and unmodified radio with the required labeling without problem so long as he used it within the regulations. That seems to me to be a tap-dance.

The bottom line to me is that the FCC has officially found that this radio complies with the requirements of Part 90 and I am legally not expected to be smarter than the FCC. If the FCC wants to change their mind and admit that they were wrong to approve the radio in the first place, they certainly can do that. In the meantime, I really doubt that any FCC enforcement official really wants to take a case before an Administrative Law Judge based ONLY on the fact that a radio which the FCC approved does not meet the standards that they approved it as meeting.

Based on past FCC actions, I do not believe there is ANY chance of being fined for using an FCC approved radio that is unmodified - the strongest action that the FCC routinely uses in technical compliance incidents is an order to stop using the non-compliant radio, more common would be an order to 'show cause' why they shouldn't issue an order to stop using the radio. An NAL would simply never happen unless you ignored the order.

Measure it…with the car off and then with it running.

It should spit out 7.4V in both cases which is what the radio likes. The adapters with problems spit out well above that when the engine is running as they don't regulate the 13.8V charging voltage properly.

Hello all, can someone answer a question for me? Will this antenna work with my uv-5ra radio? I ask because I'm a little ignorant... the radio is rated 5 watt and the antenna is rated 75 watts. Will this burn out my radio. Attached is the link.

Yes, the antenna will suck 75 watts out of the radio - NOT!
At 5 watts, you won't even warm the antenna. As long as it'sdesigned for 146 and 440 bands, it's fine. Just be sure toplace it on a ferrous surface so the magnet sticks. Theantenna is only half of the system, the metal is the groundimage that's needed to complete the circuit.

greetings,

im sure someone will correct me if i am wrong and or can provide more/better info.

the radio is rated 5 watts output, the antenna is rated for up to 75 watts input.
so your radio will be fine. however you will need an adapter to connect the antenna to the radio.

i have the same radio and the antenna arrived yesterday but i have not had a chance to use it yet. will be testing mobile reception later today.

hope this helps,
hawg

You won't be able to use that antenna for 72MHz (your RC frequency I assume).

As you can tell from the rating on it the frequency is just plain wrong for that antenna.

A 440/144 antenna will be a half wave on 440 and a quarter wave on 144. You'll find the SWR far too high on 72Mhz to be usable.

Subject: Re: [baofeng_uv5r] Re: Antenna recommendations

My primary reason for getting it would be for satellites. Also if I could make it work with my RC planes as a transmitter antenna.... that would be cool. I don't do SOTA but there are places in my commutes that are higher elevation.

I also plan to get a Yaesu ft-60r and that would be my primary radio to use with the yagi.

19 inches is a quarter wave at 146 and a three quarter wave at 440.
Odd quarter waves are about 50 ohms. An end fed half wave is over 1K ohms,and requires a matching network to feed it. Any half wave multiple is like that. ==

Arrghhh…not enough coffee this morning….please 'scuse my math error.

Wouldn’t a 2M Yagi which is ¼ wave on 2M be a center fed half wave on 72Mhz in this case?

Arrow may just not test that frequency.

I've got a home brew (i.e. tape measure) Yagi for 2M/70cm use.

Doesn't do well on 72Mhz since it Is half-wave on 2M.

I was able to bring the SWR down to around 10 by just folding the driven element in half though (thought the minimum point was more like 80Mhz since the lengths are hardly exact.

The driven element in a yagi is a half wave dipole,which is made from 2 quarter wave elements.

Thanks all. I live downtown Mann, NYC on the 19th floor. I thought this would be a good starting antenna cost/ size that I could just mount on my terrace since is metal via the magnet. I've seen inexpensive others as well but they require too much of an area to use. Any further thoughts or sites I you can offer?
Thanks,
Andrew

Does anyone know how to program DPL Tones into a Baofang using Chirp? I have no problem with PL tones but a particular frequency at 460.05 requires a Tone of 023 DPL. How do I input that into Chirp?

My VHF/UHF tape measure yagi is an SWR of 2 at 433MHz. It's easy to build and quite portable since you can fold the elements.

It should work great for your RC control.

A 10:1 SWR is a 500 or 5 ohm feedpoint.For a half wave, I'd guess closer to 500.

I'd buy from a reliable source that also happens to include a better antenna with it instead of the "stock" antenna which is well known to perform quite poorly.

I also live in NYC, Brooklyn. Just a FYI, most buildings have issues with people placing antennas on their terraces and running cable along side the building, if you plan to do so. I leave mine inside and have no issue hitting local repeaters around the city.

Thanks all. I live downtown Mann, NYC on the 19th floor. I thought this would be a good starting antenna cost/ size that I could just mount on my terrace since is metal via the magnet. I've seen inexpensive others as well but they require too much of an area to use. Any further thoughts or sites I you can offer?

Thanks,

Andrew

greetings,

im sure someone will correct me if i am wrong and or can provide more/better info.

the radio is rated 5 watts output, the antenna is rated for up to 75 watts input.
so your radio will be fine. however you will need an adapter to connect the antenna to the radio.

i have the same radio and the antenna arrived yesterday but i have not had a chance to use it yet. will be testing mobile reception later today.

hope this helps,
hawg

I have a Tram 1185 and it works great. Even from inside my 1 story aluminum siding ranch. I sit it on top of a big metal pizza pan and can reach any local repeaters. I do have an issue with the adapter I bought from Amazon for it. It was poorly made and fell apart in 2 weeks. I think it was one of
these: http://www.amazon.com/DHT-Handheld-Antenna-Baofeng-Quasheng/dp/B00COKNKS8 I'm going to replace it with 2 BNC adapters. Like http://www.amazon.com/Etekcity%C2%AE-Female-Convert-Adapter-BaoFeng/dp/B00B4OWULS and
a http://www.amazon.com/Male-SO239-Female-Coaxial-Connector/dp/B0076UHL6S That will make it a quick disconnect.

What would everybody else do get another one and hope for the best or just wait until you had the extra money and get a more expensive one.
+++

It all depends on your budget and time-frame. I really like the Wouxun KG-UV8D with 999 memories and a color screen, plus it has the ability to do cross-band repeat (very handy for short-term search and rescue work), but it's far more than $40, especially if you want it with the higher capacity battery (highly recommended). The new KG-UV899 radio doesn't come with a color screen nor cross-band support, but it does have 199 memories (vs. 128 in the Baofeng models) and is available for under $100 as well.

If your budget is nearer $100, you could look at several TYT models as well, some of which have twice the memories (256) vs. the UV-5R, some can also do 2/5 tones for fire support, and many of them also have both compandered and audio inversion support (again the use and legality of scrambled audio inversion varies from user to user and country to country - but many of the TYT radios have it, Baofeng's do not). Another issue is FCC Part 90 certification, which depending on how closely you want to follow the rules, many UV-5R units sold here are actually meant for sale overseas (and thus are missing Part 90 certification, including one overly hyped 8w radio from Baofeng Tech). All of the TYT radios that I've seen (to date) all have Part 90 certification, as do the Wouxun models.

I personally would not recommend the rush to a 8w radio (there are several Baofeng models now available with the extra power), as "real world" tests show very little (if any) signal difference at the receiving end (provided that both radios use the same antennas, height above ground, etc.), since the extra dollars spent for "power" could be better spent (IMHO) on various accessories.

Just my .02 cents worth, other opinions may vary.

47841. Need help with repeater

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-17 22:11:21 UTC
From: bardyaaminian@...
Topic: 47841 Message: 47841

Hello!

I purchased two BaoFeng UV-5RE's on amazon and I'm trying to use a repeater nearby.
When I enter the frequency, tone, offset, etc. into CHIRP, I upload it to the radio, then I have this problem:

I send a transmission to the repeater, once I stop sending the transmission, the screen on both radios turns blue (indicating and incoming transmission) and I hear the repeater's return tone. I send another transmission on that radio, both radios turn blue after I stop, but all I hear is white noise, not my transmission.

Here is the configuration for the repeater in CHIRP:
http://i.imgur.com/mqcCleB.png http://i.imgur.com/mqcCleB.png

This is the repeater im using:
http://www.repeaterbook.com/repeaters/details.php?state_id=36&ID=219
http://www.repeaterbook.com/repeaters/details.php?state_id=36&ID=219

What am I doing wrong?

Thanks!

Topic: 47865 Message: 47865

Missionspec.com has posted several excellent videos on youtube.com.
These video segments clearly describe the setup, programming, scanning, and other useful how-to information.

I've had my UV-5R for a couple of years, and watching these videos taught me a few new things!

Between these videos and miklor.com, you should have the resources you need to fully enjoy your Baofeng UV-5R.

73's,

Paul A. Passman, WB0BBC

There are a number of things that can block you up/downloading to/from your radio. First you need a PROPER programming cable which costs about $25. NOT of of the Chinese counterfeits which are <$10, as they will do exactly what you are describing. Also the frequency your radio is tuned to when you up/download MUST be quiet. If there is any traffic, this blocks the process. There is much more which the miklor.com site will help you with including making sure the cable is fully seated into the radio and so forth. This is one of the more problematic areas for these radios.

Yes, it is key to find the genuine articles. I have gotten some fakes before the the magnets are really weak. I think the genuine articles use neodymium magnets because they hold very well as long as they are on a truly flat surface. That combined with elements which are VERY thin and lignt means very little wind resistance and inertial mass. Even at freeway speeds with passing trucks in cross winds I have never had one come loose.

And although the RG174 is very thin and easy to route through the door/window seal, there must be some loss in it, though I haven't noticed it in performance. Specs say attenuation is about double that of RG58/U per 100 feet, but they are short which is probably the saving grace.

"If" you are comfortable with using a 1" wide magnet at highway speeds -
and - you are able to source an actual Nagoya (and not a knock cheap knock
off sold on e-bay and Amazon all the time), both of these would be a
reasonable choice for those wanting to have a temporary outdoor antenna
with a direct attachment to their SMA-F connector for their handheld
radio.

Actually, a 1/4 at 144 would be a 3/4 wave at 440, not a 1/2 wave. I didn't look up the Arrow Yagi, but most VHF/UHF Yagi's don't really use a 1/4 wave driven element on VHF (or a 3/4 wave on UHF)

He didn't mention the frequency used for his RC planes, but IF he is using 72MHz, then a 1/4 wave 2M antenna would be a 1/2 wave at 72MHz and would probably work at least as well as the typical non-resonant vaguely 1/4 wave telescopic crap that comes on most 72MHz RC transmitters.

Subject: RE: [baofeng_uv5r] Re: Antenna recommendations

You won't be able to use that antenna for 72MHz (your RC frequency I assume).

As you can tell from the rating on it the frequency is just plain wrong for that antenna.

A 440/144 antenna will be a half wave on 440 and a quarter wave on 144. You'll find the SWR far too high on 72Mhz to be usable.

Subject: Re: [baofeng_uv5r] Re: Antenna recommendations

My primary reason for getting it would be for satellites. Also if I could make it work with my RC planes as a transmitter antenna.... that would be cool. I don't do SOTA but there are places in my commutes that are higher elevation.

I also plan to get a Yaesu ft-60r and that would be my primary radio to use with the yagi.

A magnetic mount mobile antenna generally works very well placed on top of a large appliance or metal shelving.

I also live in NYC, Brooklyn. Just a FYI, most buildings have issues with people placing antennas on their terraces and running cable along side the building, if you plan to do so. I leave mine inside and have no issue hitting local repeaters around the city.

Thanks all. I live downtown Mann, NYC on the 19th floor. I thought this would be a good starting antenna cost/ size that I could just mount on my terrace since is metal via the magnet. I've seen inexpensive others as well but they require too much of an area to use. Any further thoughts or sites I you can offer?

Thanks,

Andrew

I'd be shocked if you can get any BaoFeng HT to work well enough to be worth using on the 19th floor (or anywhere else) in Manhattan. These radios are quite sensitive but have almost no selectivity and the front end is easily overwhelmed by any signal on any other frequency in the same band. I grew up in NYC and I doubt that the RF levels have dropped lately. I would expect your BaoFeng HT to experience frequent bursts of static due to front end overload whenever you are not receiving a signal as well as intermod when you are receiving anything other than a very strong signal. Using an "better" antenna would generally make these conditions worse.

If you have one of the newer BaoFeng models where you can use Chirp to adjust the squelch level, you may be able to reduce the problem of random bursts of static when not receiving a signal.

That MAY get you a real FTDI cable -- or it may not -- the current listing shows BaoFeng Tech as the only seller Amazon has listed for this item, but you can't count on that for very much because the item is "Fulfilled by Amazon" which means it is stocked at an Amazon warehouse and shipped direct from the Amazon warehouse by Amazon, not by the seller. The problem is that if anyone else starts selling something that Amazon thinks is the same as an "Genuine FTDI BaoFeng Programming Cable for UV-82 / BF-F8HP / BF-F8+ / GT-3 / UV-5R Models" and signs up for the Fulfilled by Amazon program, what Amazon will do is just pile up all the "same" items in one location in the warehouse then when you order one some stock clerk will go and pull one from the pile, put it in an Amazon smiley box and put your shipping label on it. Whenever an item is "Fulfilled by Amazon" you have no way to know which seller's stock you will actually receive - and neither does the seller because Amazon prohibits sellers from having their name or any identifying marks on any item using the "Fulfilled by Amazon" program.

Fulfilled by Amazon is great for fast shipping (especially for me since I live less than 30 miles from a large Amazon warehouse) but you never know what you are going to get -- fortunately Amazon does have a great return policy for most items.

I'm pretty sure that a genuine Baofeng programming cable does not equal a genuine Prolific USB-to-TTL chip.

If I was going to purchase from Buy Two Way Radios and I didn't think I was capable of getting a programming cable with a not-genuine Prolific chip to work, I would get their "XLT Painless Programming Cable" with the FTDI USB-to-TTL chip.

You may be right…

But just ask 'em. You'll get a real answer from them. I tend to stick with the $20 FTDI cable. Definitely avoid the $5 ones. And I did have problems with a "genuine Baofeng" cable but not from BuyTwoWay (not that it makes any difference).

BuyTwoway is the best provider I've worked with other than threeoldcrows. Real answers from real people.

You may be right…

But just ask 'em. You'll get a real answer from them. I tend to stick with the $20 FTDI cable. Definitely avoid the $5 ones. And I did have problems with a "genuine Baofeng" cable but not from BuyTwoWay (not that it makes any difference).

BuyTwoway is the best provider I've worked with other than threeoldcrows. Real answers from real people.

I'm pretty sure that a genuine Baofeng programming cable does not equal a genuine Prolific USB-to-TTL chip.

If I was going to purchase from Buy Two Way Radios and I didn't think I was capable of getting a programming cable with a not-genuine Prolific chip to work, I would get their "XLT Painless Programming Cable" with the FTDI USB-to-TTL chip.

Amazon has free return so you're not losing anything by trying it. The Amazon one should be an FTDI for that much $$.

But if it doesn't pretty much work right out of the box (I assume you know how to find a COM port for it?) then I'd ship it back and go to somebody who has real customer service. You might pay a bit more for shipping.

I can tell you I got bit by a Baofeng cable and a fake Prolific and when I bought the FTDI it just worked. I could get the fake Prolific to work by using older drivers but that's not a good solution for most people.

Do NOT use the drivers and software on the CD that comes with it though (see the reviews). Use CHIRP and let the drivers automatically download.

The only thing you need to pay attention to is ensuring the thing is plugged in completely. Some radios are a bit picky about seating the plug.

I've got too many HTs and am 'cleaning house' some. Before I go to eBay, I'll offer it here. I have a UV5R for sale, with battery, antenna, charger, vinyl case, and one of those earbud speaker mikes. I got it direct from Radioshop 888 in Hong Kong. It therefore does not have the part 90 certification sticker. It is firmware BFB251 and is very good conditon (hardly any use) though the BAND button shows a little white on one outside corner.

I am asking $25 plus shipping from New England, to the US only. Contact me off list for details. Photos available.

(Also have a Baofeng UV3R Plus (same Kenwood jack as UV5R), a TYT TH-UV3R (220 capable) and a Wouxun KG-UV2D I'm selling.)

Yes. This is true. The OP indicated he couldn't transmit though. Of course, this is all in wording. Does the radio actually transmit... OR is the receiving station simply out of range.

I would imagine he is transmitting and one of the following is the issue...

- the other station(s) are out of range
- if accessing a repeater, the radio is not transmitting on the input frequency
- the receiving station(s) require a CTCSS tone or DCS code this he is
not transmitting

I know you keep saying that, but I have had several mis-filled orders which were exactly the opposite. The item fulfilled by Amazon from a seller was incorrect in one case because it was a 2 for and I received only 1. When I contacted Amazon, they said they could not replace it, the seller had to because it was their inventory.

This is because the seller provides stock labeled to Amazon's standards and Amazon just picks it by the label. They have no idea what it is and cannot substitute. They can only sell what the seller sends them under that label.

That's how customer service explained the process to me after several such orders. Maybe you had a different experience, but that doesn't necessarily make it the norm.

If you think about how a modern fully automated fulfillment center works, there are no human decisions. It is an automated pick and fill process where no one decides that if an item isn't where it is supposed to be someone decides to find it somewhere else.

After talking to a couple friends that just started working at a new nearby Amazon fulfillment center, they say it is extremely automated. Most items are picket by robot and transported to the shipping area. No human is ever in the loop. Items that cannot be picked by robot like very small bagged items get the bin picked where a person graps the part and the bin is returned by the robot on it's next trip back to that area. Nowhere in the process does a human even know what the item is thay are handling unless they happen to recognize it. Inventory control systemd intercept any pick process before anything ever happens, in some cases as the customer is placing their order. There are small differences between the different fulfillment centers, but they said they were told that it is almost the same everywhere.

I just don't see the kind of illegal conspiracy you describe being institutionalized in such a company. Not saying it is impossible, but seems quite unlikely with the way fulfillment centers work today. Think of what would happen if sellers found out that their inventory was being taken from their stock without compensation and the records falsified to cover it up on a large scale. Their inventory control statements alone would have huge unexplained variances.

Oh and yes I too purchased a cable from that link and got the genuine article.

That MAY get you a real FTDI cable -- or it may not -- the current listing shows BaoFeng Tech as the only seller Amazon has listed for this item, but you can't count on that for very much because the item is "Fulfilled by Amazon" which means it is stocked at an Amazon warehouse and shipped direct from the Amazon warehouse by Amazon, not by the seller. The

problem is that if anyone else starts selling something that Amazon thinks is the same as an "Genuine FTDI BaoFeng Programming Cable for UV-82 / BF-F8HP / BF-F8+ / GT-3 / UV-5R Models" and signs up for the Fulfilled by Amazon program, what Amazon will do is just pile up all the "same" items in one location in the warehouse then when you order one some stock clerk will go and pull one from the pile, put it in an Amazon smiley box and put your shipping label on it. Whenever an item is "Fulfilled by Amazon" you have no way to know which seller's stock you will actually receive - and neither does the seller because Amazon prohibits sellers from having their name or any identifying marks on any item using the "Fulfilled by Amazon" program.

Fulfilled by Amazon is great for fast shipping (especially for me since I live less than 30 miles from a large Amazon warehouse) but you never know what you are going to get -- fortunately Amazon does have a great return policy for most items.

It's not just UV-5R stuff….

It's a well-known problem with all FBA items.

http://venturebeat.com/2014/01/08/fulfillment-by-amazon-what-amazon-doesnt-tell-third-party-sellers/

I've heard of complaints with numerous types of merchandise.

When I was in the USAF they called it "suitable substitution" and if you weren't careful about your specs you could end up getting something completely different.

Amazon probably pulls out possible matches by the description and I shudder to think of what an automated system would do. Though it may work 99% of the time.

Yes, the picture of the top of a pole and half an antenna could have been taken from a different angle that would allow us to see exactly how it is mounted, in the other picture there are no electrical contacts between the antenna and the overhead cables, leaving electrocution to luck instead of a certainty.
Or could it be....they are both no good for satellite reception?

It sounds like there could be a voltage leakage in the headset during changeover, you could try decoupling the audio to the speaker with a capacitor, this should block the dc voltage something like a 10uF ceramic, might just be worth a try, would obviously involve either modding the radio, or better still modding the headset if you can get inside it.

WOW!!! I stand enlightened, at least as of a year ago. I wouldn't think with the huge variation in products this could happen, but at least according to the article, it is an "opt in by default" agreement with sellers. Knowing all the variations in just the Baofeng UV5R radios, it IS scary knowing that your research points you to buying it from a certain reputable seller and getting some outdated or otherwise different product is possible. Although I doubt it is common, with as many variations in certain products, it is a little scary. But that's why I ALWAYS buy from sellers that have Amazon's refund/return policy. Even then you can have problems with FBA products if the seller isn't very service oriented as I have already encountered.

I had one order where it was FBA Prime and it was wrong. Amazon told me that since it was the seller's inventory I had to contact them. I tried from the seller's details page but the Contact Us link just took me back to Amazon. I explained again and Amazon gave me a refund without return. I gave that seller the appropriately negative review (not product review) for not being able to be contacted when they are responsible for a wrong order and they kept trying to bribe me to upgrade it. I told them as soon as they made the Contact Us link actually contact them I would. They never did.

"Michael Black" mdblack98

It's not just UV-5R stuff….

It's a well-known problem with all FBA items.

http://venturebeat.com/2014/01/08/fulfillment-by-amazon-what-amazon-doesnt-tell-third-party-sellers/

I've heard of complaints with numerous types of merchandise.

When I was in the USAF they called it "suitable substitution" and if you weren't careful about your specs you could end up getting something completely different.

Amazon probably pulls out possible matches by the description and I shudder to think of what an automated system would do. Though it may work 99% of the time.

Hi all,

I recently bought a UV-5RA, and it seems to work well. There's one annoyance I have with it though; every time I power it on, the R-CTCS setting (menu item #11) is again set to 69.3HZ, and I have to manually set it to OFF before I can hear anybody's transmissions.

Is there some reason why this setting doesn't stay OFF across a power cycle? How can I remedy the situation?

Thanks,
Jeremy

I too bought one of these radios to test with our fire department because of the 2/5 tone, but in the specs, it says this feature is "optional" however I don't see where you can get it with or with out this option. All I know is that the one I have will not work. I don't want to tie up the UV-5R group talking about it, but when this came up, I had to ask because I have found little info on this radio. Would be nice if we could get a nice cheap alternative to the Motorola.

+++

A) It is far,far more common than you'd think (I can speak from experience), and
B) All sellers (even tiny sellers that sell one item a year) are required to at least match Amazon's refund/return policy (although many of them neglect to post the information or simply hope you are unaware of it), and
C) Many times the third-party seller did NOTHING wrong, but will get dinged anyway by Amazon's crazy computer rating system, and
D) Even though you are refunded 100%, the third-party seller is still charged a percentage of the sale by Amazon.

Well, I'm replying to you as both an Amazon third-party seller AND as a buyer, whereas your knowledge of the inner workings of Amazon appears to be 100% based as a buyer. In addition, I also know 2 different folks that work inside Amazon as part of their pick, pack, and ship group who have shared various details that Amazon would prefer not to be well known to the general public (only some of which is starting to show up on various web-sites and blogs).

The various different answers we get from Amazon Seller Support (on the same question/order) are legendary, so it would not surprise me one bit that someone in Amazon customer support would try to paint the third-party seller as the bad guy during your call, with Amazon then looking like the Knight on the White Horse to you as a buyer.

Amazon is more than happy to refund your third-party order 100% (even if their FBA department screwed it up, which is why there is at least one lawsuit that I know of making it's way through the courts as we speak), after all they still charge the third-party merchant their monthly listing fees (making money), they only refund a portion of the Amazon commission fee's charged back to the seller's account (making more money), they still charge commission rates anywhere from 6 to 20% on every sale on top of their monthly fixed selling fees (making more money), and if you ship your products to the local Amazon warehouse (as a seller), they then charge you another monthly fee for storage (making more money again). As a seller, I too would be more than happy to offer a ridiculous return policy, free freight, etc. if somebody else still paid me money for each sale I refunded, especially if I alone got to decide how much money I charged somebody else on every return of their product. I'm sure you would as well.

The two biggest issues most sellers have with Amazon is that if Amazon (and Amazon alone) decides to co-mingle your product (say a UV-5R) with another seller's UV-5R units (and the other seller's units are all defective/different color, missing a item, etc., etc.), the "good" seller has no way to stop it (so the good seller may get blamed for defective product shipments), and if Amazon decides to re-ship your products to a different warehouse in another state (so Amazon can ship faster/cheaper), the third-party seller is now liable for taxes in that state (a state where the third-party seller has no nexus, did not authorize the out of state shipments, but Amazon didn't ask).

Hopefully the courts will force Amazon to charge that policy, but just like they used an Army of lawyers to fight not paying taxes in various states for years (and finally settled for pennies on the dollar for back taxes owed years later), you can be sure that they will fight it for years into the future so long as they feel it gives them any advantage.

What the hell are you babbling about? Do you even know what message you are replying to?? You start out with "I know you keep saying that, but I have had several mis-filled orders which were exactly the opposite" and then you babble on and on describing exactly what I had said in the first place. Perhaps you intended to reply to some other message - such as maybe the message from the guy who said all his orders from Amazon were always perfect? In any case I don't see anyone but you who has ever mentioned any "illegal conspiracy"

As for sellers stock and compensation, you might want to look at Amazon's contract for the Fulfilled By Amazon program. If there are multiple sellers who sell the "same" item, Amazon does completely mingle the stock and makes no attempt to sort by seller. If five companies sell Widgets through Fulfilled By Amazon, all that happens at the warehouse is that all the Widgets are in one place on the shelves. When a customer orders a Widget, Amazon credits that sale to the seller identified in the listing on the website when the customer clicked to buy it. Amazon credits that seller for the sale, subtracts the number sold from the seller's stock count, deducts their fees, and gives that seller his money - this is all done automatically by computer. At the same time, the same computer sends the transaction to the warehouse where the Widgets are all stored. Someone (either a person or a robot, depending on the item and the warehouse) picks A WIDGET off the shelf, puts it in an Amazon box, adds a shipping label with the customer's address, and sends the item out by the shipping method selected. Note that there is NO way for anyone at the warehouse to know which seller provided the individual WIDGET that was picked and shipped because all the WIDGETS are identically marked per Amazon requirements. It does not matter to Amazon who provided the WIDGET because according to the contract those WIDGETS are all identical and completely interchangeable. When there are multiple sellers of the same item, Amazon has a complex fully automated system to determine which seller gets shown in the listing unless the customer looks at the part of the listing that says "## new from $$$$$" which shows the number of different sellers and the lowest price. If you click on that link you will get a list of all the sellers that Amazon thinks are selling the SAME item. Some of those sellers may be using Fulfilled By Amazon, some may not. For those that are using Fulfilled By Amazon, their stock is all mixed together at an Amazon warehouse. Those that are not using Fulfilled By Amazon maintain their own stock and do their own shipping.

If you look at the reviews for items like this cable, you will see that some people got the right item, some people got an item that is listed as the right item but obviously isn't really the same item. Unfortunately the situation with reviews is even more complex than just the Fulfilled By Amazon issue because Amazon mixes reviews for "the same item" including ALL dealers who sell that item through Amazon.

Subject: [baofeng_uv5r] Re: Returning my uv-5r

I know you keep saying that, but I have had several mis-filled orders which were exactly the opposite. The item fulfilled by Amazon from a seller was incorrect in one case because it was a 2 for and I received only 1. When I contacted Amazon, they said they could not

replace it, the seller had to because it was their inventory.

This is because the seller provides stock labeled to Amazon's standards and Amazon just picks it by the label. They have no idea what it is and cannot substitute. They can only sell what the seller sends them under that label.

That's how customer service explained the process to me after several such orders. Maybe you had a different experience, but that doesn't necessarily make it the norm.

If you think about how a modern fully automated fulfillment center works, there are no human decisions. It is an automated pick and fill process where no one decides that if an item isn't where it is supposed to be someone decides to find it somewhere else.

After talking to a couple friends that just started working at a new nearby Amazon fulfillment center, they say it is extremely automated. Most items are picket by robot and transported to the shipping area. No human is ever in the loop. Items that cannot be picked by robot like very small bagged items get the bin picked where a person graps the part and the bin is returned by the robot on it's next trip back to that area. Nowhere in the process does a human even know what the item is thay are handling unless they happen to recognize it. Inventory control systemd intercept any pick process before anything ever happens, in some cases as the customer is placing their order. There are small differences between the different fulfillment centers, but they said they were told that it is almost the same everywhere.

I just don't see the kind of illegal conspiracy you describe being institutionalized in such a company. Not saying it is impossible, but seems quite unlikely with the way fulfillment centers work today. Think of what would happen if sellers found out that their inventory was being taken from their stock without compensation and the records falsified to cover it up on a large scale. Their inventory control statements alone would have huge unexplained variances.

Oh and yes I too purchased a cable from that link and got the genuine article.

Re: Returning my uv-5r Sun Jan 18, 2015 4:51 am (PST) . Posted by: "Xaun Loc" xaunloc That MAY get you a real FTDI cable -- or it may not -- the current listing shows BaoFeng Tech as the only seller Amazon has listed for this item, but you can't count on that for very much because the item is "Fulfilled by Amazon" which means it is stocked at an Amazon warehouse and shipped direct from the Amazon warehouse by Amazon, not by the seller. The problem is that if anyone else starts selling something that Amazon thinks is the same as an "Genuine FTDI BaoFeng Programming Cable for UV-82 / BF-F8HP / BF-F8+ / GT-3 / UV-5R Models" and signs up for the Fulfilled by Amazon program, what Amazon will do is just pile up all the "same" items in one location in the warehouse then when you order one some stock clerk will go and pull one from the pile, put it in an Amazon smiley box and put your shipping label on it. Whenever an item is "Fulfilled by Amazon" you have no way to know which seller's stock you will actually receive - and neither does the seller because Amazon prohibits sellers from having their name or any identifying marks on any item using the "Fulfilled by Amazon" program.

Fulfilled by Amazon is great for fast shipping (especially for me since I live less than 30 miles from a large Amazon warehouse) but you never know what you are going to get -- fortunately Amazon does have a great return policy for most items.

Actually the close-up picture does not show the antenna at all! It shows the mast that is attached to the top of what most of us old timers would call a "telephone pole" or "utility pole" - a tall wood pole about 8-12 inches diameter at the base tapering to about 6 inches diameter at the top. The first picture shows that the mast is mounted to the top of the pole, then the antenna is mounted to the mast.

Occasionally Amazon (like any shipper) does screw up and ships the wrong item - it is rare, but it can happen But with Fulfilled by Amazon there is always a chance that the "right" item will still be wrong.

FBA works fine as long as ALL the sellers of a particular item really are selling exactly the same item.

FBA is like going to a grocery store where you would order everything from a list. If you buy "five pounds of granulated sugar" do you really care if that sugar came from Domino or some white label generic brand as long as it really is five pounds of granulated sugar. On the other hand, if you are buying "one pound of corn flakes" you might or might not care if those corn flakes were Kellogs or Post or generic white box.

The problem comes up when one seller is passing off something different - particularly if it happens to be defective or simply different in a way that doesn't work for the buyer.

In the grocery store example, suppose one seller labeled their product just as "five pounds of sugar" but failed to mention that it was powdered sugar instead of granulated sugar. THAT would make a difference to you if you wanted granulated sugar for your morning coffee wouldn't it? You would expect the grocery to know that powdered sugar and granulated sugar are NOT THE SAME THING. The problem is that Amazon generally doesn't know any more than what it in the brief description (title) of the product that a seller offers.

Do a search on Amazon for Baofeng UV5R -- even after you ignore the accessories and other crap and look at just the radio listings, you will find several listings that Amazon thinks are different because the seller described them a little differently as well as several that Amazon thinks are the same because the seller used the same title for his product.

In the past there have been sellers on Amazon who were selling UV5R radios that were probably factory QC rejects or radios that had been returned as defective. The returned radios might very well have nothing wrong with them (often the only problem was a stupid buyer) or they might have a problem that the next buyer would never notice.

Subject: [baofeng_uv5r] Re: Returning my uv-5r

WOW!!! I stand enlightened, at least as of a year ago. I wouldn't think with the huge variation in products this could happen, but at least according to the article, it is an "opt in by default" agreement with sellers. Knowing all the variations in just the Baofeng UV5R radios, it IS scary knowing that your research points you to buying it from a certain reputable seller and getting some outdated or otherwise different product is possible. Although I doubt it is common, with as many variations in certain products, it is a little scary. But that's why I ALWAYS buy from sellers that have Amazon's refund/return policy. Even then you can have problems with FBA products if the seller isn't very service oriented as I have already encountered.

I had one order where it was FBA Prime and it was wrong. Amazon told me that since it was the seller's inventory I had to contact them. I tried from the seller's details page but the Contact Us link just took me back to Amazon. I explained again and Amazon gave me a refund without return. I gave that seller the appropriately negative review (not product review) for not being able to be contacted when they are responsible for a wrong order and they kept trying to bribe me to upgrade it. I told them as soon as they made the Contact Us link actually contact them I would. They never did.

Re: Returning my uv-5r Sun Jan 18, 2015 1:49 pm (PST) . Posted by: "Michael Black" mdblack98 It's not just UV-5R stuff….

It's a well-known problem with all FBA items.

http://venturebeat.com/2014/01/08/fulfillment-by-amazon-what-amazon-doesnt-tell-third-party-sellers/

I've heard of complaints with numerous types of merchandise.

When I was in the USAF they called it "suitable substitution" and if you weren't careful about your specs you could end up getting something completely different.

Amazon probably pulls out possible matches by the description and I shudder to think of what an automated system would do. Though it may work 99% of the time.

Off hand I don't see anything wrong with the close-up (other than both pictures being sideways). The distant picture does show a situation where IF the telephone pole used to hold the antenna happened to fall over it would take out a lot of telephone and power lines.

For a fire department, I'd recommend sticking with Motorola. I like my UV-5R, but I wouldn't depend on it for any critical application. The Motorola will have better selectivity, better sensitivity, and better durability, resulting in the ability to communicate in more adverse conditions. For a fire department, I'd think that this would be critical. And the Motorolas will support more US jobs. Yes, manufacturing is in China, but all the engineering is in the US.

I'll believe the better selectivity….but you got anything to back up the sensitivity claim?

Durability should be based on amortized cost. And I'd bet the UV5R would win hands down on that one.

The main things that would make me hesitate is the lack of a rotary switch to change channels and the inability to screw down the mic connector.

Anybody know the cheapest Part 90 HT that might have those features?

No, I don't have any hard data to back up the sensitivity claim. However, better selectivity is usually a result of narrower filter bandwidths, which results in lower noise floors, which usually results in better sensitivity. Unless it was designed by idiots. And I'm assuming that Motorola radios are not designed by idiots.

Plus, the UV-5R is optimized for 2m. All other bands are a compromise. The Motorola radios are optimized for the appropriate bands, which is one of the reasons they cost more.

How do you amortize the cost of durability when a firefighter is in the middle of an emergency, and his radio won't work? If they're all carrying multiple radios, this might work. If you're just looking at purchase and replacement costs, I'm sure the Baofeng's come out ahead. But if communications may result in life or death, how can you even THINK of not using the most dependable equipment possible?

The more I read this list, the more I become convinced that Baofeng's are NOT suitable for life critical communications. But heck, I wouldn't expect that of a $30 radio.

My UV-5R has been working better then my HTX-420.All the DTMF tones still work on my '5R.
Only halfof the buttons on my '420 make the right tone now.
The HTX-420 cost way more then my UV-5R.

Wrong on both counts. Don't assume. ;-)

Since I've only been a ham for almost 12 years,it's not a 15 year old radio. Maybe 7 or 8. My'5R is almost 3 years old. The right side of thedisplay is dark but still readable and worksbetter then the '420 does.

I think most of us would agree that any radio (Motorola, Icom, Kenwood, etc.) that costs many times more than a Chinese radio "should" work better, have a longer life, etc., but many times the costs of these radios prevent some departments from giving everyone a radio. So if it's a question of giving a couple of folks an expensive radio (and leaving some folks with nothing), or giving everyone a radio - I can see why some smaller departments (especially volunteer departments) choose the second option.

One of the troubling facts that has come out from the loss of the 19 firefighters in AZ was that only 6 of the 20 hotshots had a radio because the department didn't have the budget for getting everyone the more expensive radios. We'll never know for sure if everyone having a radio would have made any difference, but only the spotter got out alive.

Actually it's all in the thread you copied. As for the profanity and belittling, I don't see the need unless you have no other means to express yourself.

I did have one post which even though I used the web post process ended up in the wrong thread, but I deleted it within 5 minutes and still it ended up in the next digest which was hours later. Still haven't figured out how to do this 100% successfully.

What the hell are you babbling about? Do you even know what message you are replying to?? You start out with "I know you keep saying that, but I have had several mis-filled orders which were exactly the opposite" and then you babble on and on describing exactly what I had said in the first place. Perhaps you intended to reply to some other message - such as maybe the message from the guy who said all his orders from Amazon were always perfect? In any case I don't see anyone but you who has ever mentioned any "illegal conspiracy"

As for sellers stock and compensation, you might want to look at Amazon's contract for the Fulfilled By Amazon program. If there are multiple sellers who sell the "same" item, Amazon does completely mingle the stock and makes no attempt to sort by seller. If five companies sell Widgets through Fulfilled By Amazon, all that happens at the warehouse is that all the Widgets are in one place on the shelves. When a customer orders a Widget, Amazon credits that sale to the seller identified in the listing on the website when the customer clicked to buy it. Amazon credits that seller for the sale, subtracts the number sold from the seller's stock count, deducts their fees, and gives that seller his money - this is all done automatically by computer. At the same time, the same computer sends the transaction to the warehouse where the Widgets are all stored. Someone (either a person or a robot, depending on the item and the warehouse) picks A WIDGET off the shelf, puts it in an Amazon box, adds a shipping label with the customer's address, and sends the item out by the shipping method selected. Note that there is NO way for anyone at the warehouse to know which seller provided the individual WIDGET that was picked and shipped because all the WIDGETS are identically marked per Amazon requirements. It does not matter to Amazon who provided the WIDGET because according to the contract those WIDGETS are all identical and completely interchangeable. When there are multiple sellers of the same item, Amazon has a complex fully automated system to determine which seller gets shown in the listing unless the customer looks at the part of the listing that says "## new from $$$$$" which shows the number of different sellers and the lowest price. If you click on that link you will get a list of all the sellers that Amazon thinks are selling the SAME item. Some of those sellers may be using Fulfilled By Amazon, some may not. For those that are using Fulfilled By Amazon, their stock is all mixed together at an Amazon warehouse. Those that are not using Fulfilled By Amazon maintain their own stock and do their own shipping.

If you look at the reviews for items like this cable, you will see that some people got the right item, some people got an item that is listed as the right item but obviously isn't really the same item. Unfortunately the situation with reviews is even more complex than just the Fulfilled By Amazon issue because Amazon mixes reviews for "the same item" including ALL dealers who sell that item through Amazon.

Subject: [baofeng_uv5r] Re: Returning my uv-5r

I know you keep saying that, but I have had several mis-filled orders which were exactly the opposite. The item fulfilled by Amazon from a seller was incorrect in one case because it was a 2 for and I received only 1. When I contacted Amazon, they said they could not replace it, the seller had to because it was their inventory.

This is because the seller provides stock labeled to Amazon's standards and Amazon just picks it by the label. They have no idea what it is and cannot substitute. They can only sell what the seller sends them under that label.

That's how customer service explained the process to me after several such orders. Maybe you had a different experience, but that doesn't necessarily make it the norm.

If you think about how a modern fully automated fulfillment center works, there are no human decisions. It is an automated pick and fill process where no one decides that if an item isn't where it is supposed to be someone decides to find it somewhere else.

After talking to a couple friends that just started working at a new nearby Amazon fulfillment center, they say it is extremely automated. Most items are picket by robot and transported to the shipping area. No human is ever in the loop. Items that cannot be picked by robot like very small bagged items get the bin picked where a person graps the part and the bin is returned by the robot on it's next trip back to that area. Nowhere in the process does a human even know what the item is thay are handling unless they happen to recognize it. Inventory control systemd intercept any pick process before anything ever happens, in some cases as the customer is placing their order. There are small differences between the different fulfillment centers, but they said they were told that it is almost the same everywhere.

I just don't see the kind of illegal conspiracy you describe being institutionalized in such a company. Not saying it is impossible, but seems quite unlikely with the way fulfillment centers work today. Think of what would happen if sellers found out that their inventory was being taken from their stock without compensation and the records falsified to cover it up on a large scale. Their inventory control statements alone would have huge unexplained variances.

Oh and yes I too purchased a cable from that link and got the genuine article.

_____ _____ _____ _____ _____ _____ _
Re: Returning my uv-5r Sun Jan 18, 2015 4:51 am (PST) . Posted by: "Xaun Loc" xaunloc That MAY get you a real FTDI cable -- or it may not -- the current listing shows BaoFeng Tech as the only seller Amazon has listed for this item, but you can't count on that for very much because the item is "Fulfilled by Amazon" which means it is stocked at an Amazon warehouse and shipped direct from the Amazon warehouse by Amazon, not by the seller. The problem is

that if anyone else starts selling something that Amazon thinks is the same as an "Genuine FTDI BaoFeng Programming Cable for UV-82 / BF-F8HP / BF-F8+ / GT-3 / UV-5R Models" and signs up for the Fulfilled by Amazon program, what Amazon will do is just pile up all the "same" items in one location in the warehouse then when you order one some stock clerk will go and pull one from the pile, put it in an Amazon smiley box and put your shipping label on it. Whenever an item is "Fulfilled by Amazon" you have no way to know which seller's stock you will actually receive - and neither does the seller because Amazon prohibits sellers from having their name or any identifying marks on any item using the "Fulfilled by Amazon" program.

Fulfilled by Amazon is great for fast shipping (especially for me since I live less than 30 miles from a large Amazon warehouse) but you never know what you are going to get -- fortunately Amazon does have a great return policy for most items.

47931. Tram 1185 Antenna Dilema

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-19 19:23:48 UTC
From: cprendon@...
Topic: 47931 Message: 47931

I have 3 different meg mount dual band (VHF/UHF) antennas. But my Tram 1185 is doing something very strange which I am sure someone has an explanation for. I do not have any SWR meter or the like, so this is just listening/talking and noticing differences.

The Tram is located in the center of a flat van roof and the cable routed through very soft window molding with a SO239 to SMA 12" adapter cable.There are no compression marks on the cable so it doesn't seem to be getting crushed.I have two adapter cables from different manufacturers and have tried both.

Here's what happens. Everything works fine on VHF. Full quieting from area repeaters and I seem to get out well. When the vehicle isn't moving the same is true with the UHF repeaters in my area. However as soon as I start moving, the recieve signal starts getting VERY noisy and cutting out baldly (UHF 440 - 446). The same repeaters which have VHF links are fine on that side. The faster the speed the more noise and cutout. Even in open farm fields to minimize signal bounce/reflection. I have cleaned the threads where the antenna connects to the base. It's brand new. I haven't touched the tuning as it is supposed to be factory tuned. I have rotated the antenna in case the wind forces were making an intermittent connection. My other mag mount dual bands exhibit no such properties so it doesn't seem to be a characteristic of UHF in my surroundings. It is isolated to this antenna.

Any wisdom here? There seems to be plenty in this group.

I think that when you are moving the antenna, starting to bend, as that happends the swr's are rasing, due to the grounding from the roof. make sure of the bending issue, by having someone follow you and watch and see.

Wouldn't that happen to a similar degree on my other dual banders as well? More on some than others I'm sure, but it doesn't happen at all on the other two when mounted in the same position.

"the recieve signal starts getting VERY noisy and cutting out baldly..."

Have you tried coating the antenna with rogaine foam? (Sorry, couldn't help myself).

We are a volunteer organization that gets 2/3rds of it funding from donations and fund drives, and the UV-5R and the UV-82Cs have been great. All of our field officers get Motorola equipment issued to them, but more often then not, they prefer the Baofeng over the Motorola.Also, it would be nice to have something to fall back on when the Motorola are off being repaired, or for junior or probationary members. We would program program them not to transmit, but only to receive for those guys. I would also like to be to have one to transmit our tones to do pagers tests every ones in a while without having to go though dispatch, or when we program a new batch of pagers.

OK, given the option of one Motorola for every 3 or 4 firefighters, vs one Baofeng for each... I can see the advantage of going with the Baofengs.

One other question related to this. I also have a mag mount CB antenna (yes 11 meter CB) which I would like to place on the same roof, though I assume there is the possibility of it causing reflections/refractions of my UHF signals. Is there a safe distant to separate these two to prevent any interference? I have 11 feet of roof to play with. Of course I don't want to place one on the edge and create a dead side.

The HTX-202 is 2 meter only and no tones.The HTX-420 is dual band with PL.The UV-5R is a dual band with PL and DPL.
I have 1 single band 2 meter, an IC-2100H.That radio has awesome rejection comparedto the '420 & '5R. The only other singleband radios I have are an HTX-10 and anRCI2950 for 10 meters. Neither holds acandle to the receive on my FT-857D.
You can't work 'em if you can't hear 'em.

I have a UV-82 and UV-5R. I haven't tried either one with an external mobile antenna but I have noticed what may be the same thing or something similar to the OP's problem on both radios that only occurs when they are moving.

If the radio is moving I hear a low level crackling or rapid pulse type sound that sounds almost like a geiger counter. (If you don't know what a geiger counter sounds like see https://www.youtube.com/watch?v=upPiJ9vOYiY). It is much more pronounced on UHF than on VHF the pulse/crackle rate increases as the speed the radio is moving at increases. It isn't normal picket fencing because it does it on extremely strong full quieting signals. I have never heard this on any other radio in over 30 years of using UHF hand held and mobile radios.

I think it maybe is SDR software artifacts from phase shifts or multipath.

I don't know if this is a characteristic of the RDA1846 chip, if it is a result poor software engineering by the manufacturer, or something else.

Tom

Hi Jim,

>You can change the parameters of a memory channel. You have to erase
>the channel and program it again with the new parameters.

Thanks for your reply. I tried deleting and then re-creating the memory channel, but that did not clear the fault; the radio would still power up with the "CT" icon visible at the left side of the display.

At that point, I figured it must be in some strange fault state, so I did a "RESET ALL" on the radio and reprogrammed it from scratch (using the radio's buttons, not with a USB cable), and now it is behaving the way I want it to.

Cheers,
Jeremy

47946. What's the best way to disable the external PTT button that sits on the earpiece wire?

Yahoo group: baofeng_uv5r (2015)

From: jfriesne@...
Topic: 47946 Message: 47946

Hi all,

My UV-5RA came with a earpiece/microphone attachment that I can plug in to the side; it's very handy, but I noticed that there is a little silver PTT button included (it sits about halfway down the cord), and that this PTT button sometimes activates when I don't want it to.

My question is, is there a good way to disable this external PTT button, so that I can use the earpiece to listen without risking unintentionally keying the mic? Preferably the solution would still allow me to use the unit's built-in PTT button. I suppose I could try wrapping the external PTT button in duct tape or something, but I thought I'd check first to see if there is a more elegant solution than that.

Thanks,
Jeremy

47947. CB + HAM on one roof

The safe distance AFAIK, is considered to be half wavelength. However, as VHF/UHF antenna is a lot smaller that 11m, it should not affect your CB antenna as much. CB antenna might affect the VHF performance though.

I would rather put CB antenna as close to the middle of the roof, for it needs as much ground plane as it can get (and it would still not get enough!). VHF/UHF can go as far as possible from it, provided it is still at least half-VHF wavelength from the edge of the roof.

Higher road speeds cause the antenna to oscillate, which can generate noise and "picket fencing". Are your other antennas sturdier than the Tram?

>
> The Tram is located in the center of a flat van roof and the cable routed through very soft window molding with a SO239 to SMA 12" adapter cable.There are no compression marks on the cable so it doesn't seem to be getting crushed.I have two adapter cables from different manufacturers and have tried both.
>
> Here's what happens. Everything works fine on VHF. Full quieting from area repeaters and I seem to get out well. When the vehicle isn't moving the same is true with the UHF repeaters in my area. However as soon as I start moving, the recieve signal starts getting VERY noisy and cutting out baldly (UHF 440 - 446). The same repeaters which have VHF links are fine on that side. The faster the speed the more noise and cutout. Even in open farm fields to minimize signal bounce/reflection. I have cleaned the threads where the antenna connects to the base. It's brand new. I haven't touched the tuning as it is supposed to be factory tuned. I have rotated the antenna in case the wind forces were making an intermittent connection. My other mag mount dual bands exhibit no such properties so it doesn't seem to be a characteristic of UHF in my surroundings. It is isolated to this antenna.

No, they are made of much thinner masts with 1 (like the Tram) and 2 coils midway. They are Nagoya UT106 and UT108 genuines. Or at least they seem to be. How can one know for sure with all the knock-offs... Very strong magnets and well made as well as perform well. They have somewhat shorter masts. I would expect these to oscillate even more and at lower speeds since they are lighter and shorter.

You might be on to something. I am going to have someone follow me and watch to see if the mast vibrates at least visibly. I never hear the telltale humming that usually happens with a vibrating mast, especially roof top. I can't imagine such a sturdy element (Tram) doing so at such low speeds. I will also try putting it in different positions in the slipstream.

Thanks Jardy.

Actually, Motorola radios are also Cheap Chinese radios -- perhaps a little better than BaoFeng, but nothing like the quality that old timers remember from the days when Motorola radios were built like a brick (and looked and weighed about the same as a brick).

There are far better choices than Motorola, they also cost more than Motorola, but you get more of what you pay for.

From your description it is hard to tell if your receive signal is getting weaker or if there is some sort of RF interference being created by the van when it is moving.

You mentioned having three different mag mount antennas and that apparently only the Tram 1185 has this problem. Have you tried using one of the other antennas in the same place where you normally have the Tram 1185 antenna?

There are several things you can try.

First is to try one of your other antennas in the same place where you have the Tram 1185.

You could also try the Tram 1185 on another vehicle

You could try the Tram 1185 INSIDE the van - be sure it is mounted on metal and vertical (either right-side-up or up-side-down) - this will eliminate any wind effects. The Tram 1185 on top of your van will detune somewhat in the wind but it should not cause the specific problems you are seeing.

Subject: [baofeng_uv5r] Tram 1185 Antenna Dilema

I have 3 different meg mount dual band (VHF/UHF) antennas. But my Tram 1185 is doing something very strange which I am sure someone has an explanation for. I do not have any SWR meter or the like, so this is just listening/talking and noticing differences.

The Tram is located in the center of a flat van roof and the cable routed through very soft window molding with a SO239 to SMA 12" adapter cable.There are no compression marks on the cable so it doesn't seem to be getting crushed.I have two adapter cables from different manufacturers and have tried both.

Here's what happens. Everything works fine on VHF. Full quieting from area repeaters and I seem to get out well. When the vehicle isn't moving the same is true with the UHF repeaters in my area. However as soon as I start moving, the recieve signal starts getting VERY noisy and cutting out baldly (UHF 440 - 446). The same repeaters which have VHF links are fine on that side. The faster the speed the more noise and cutout. Even in open farm fields to minimize signal bounce/reflection. I have cleaned the threads where the antenna connects to the base. It's brand new. I haven't touched the tuning as it is supposed to be factory tuned. I have rotated the antenna in case the wind forces were making an intermittent connection. My other mag mount dual bands exhibit no such properties so it doesn't seem to be a characteristic of UHF in my surroundings. It is isolated to this antenna.

Any wisdom here? There seems to be plenty in this group.

Picket fencing would not account for the symptoms as he described. It would rarely be significant while in a wide open area.

What you're describing is called "picket fencing" and is due to reflections (i.e. multi-path) that UHF is much more likely to do.
Not6hing you can do about it...except drive slower :-)

70-centimeter band - Wikipedia, the free encyclopedia

70-centimeter band - Wikipedia, the free encyclopedia
The 70-centimeter amateur radio band is a portion of the UHF radio spectrum. This band is used by amateurs engaged in emergency communications where portable and mobile radios are frequently used. Many such radios have dual-band capabilities, operating on both the 70-centi...

Are you using the Baofeng radio with a battery eliminator? If so, try the radio with just the battery attached. Your noise might be power related.

Does this happen when the engine is running, idle and increases when you accelerate or just rev the engine at high rpm.

Does this happen in other vehicles?

Subject: Re: [baofeng_uv5r] TYT FH-8

  The HTX-202 is 2 meter only and no tones.The HTX-420 is dual band with PL.The UV-5R is a dual band with PL and DPL.
I have 1 single band 2 meter, an IC-2100H.That radio has awesome rejection comparedto the '420 & '5R. The only other singleband radios I have are an HTX-10 and anRCI2950 for 10 meters. Neither holds acandle to the receive on my FT-857D.
You can't work 'em if you can't hear 'em.

From: "baofeng@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com>

Sorry, my bad - I was thinking the htx202.

I tried a bunch of things that were suggested and a few of my own and I believe the cause is multipathing.. Here is a summary of my non-instrumental non-empirical testing. Each antenna was placed in the same position under the same conditions and compared with multiple repeaters from <1 mile to 50 miles distant all UHF from 440 - 445 and VHF 145 - 147 many linked pairs.

Nearer TX source better, far worse.
Stronger TX source better, weaker worse.
Moving even at 5mph causes problem to start.
Shorter antennas (Nagoyas) better, longer (longest is the Tram) worse. Even AV-85 on radio inside vehicle is better than Tram on roof.
Faster is worse and slower is better.
Moving to different positions on roof had no effect.
Non rhythmic noise. Unlike picket fencing. Random crackle and drops.
Antenna inside vehicle better, outside worse. (negates gain being the only factor)
VHF from same repeater, no problem.
Not related to engine speed, only road speed.

Just knowing what I do about theory (sorry my engineering background is Telecommunications as in landline), this seems to point pretty strongly to multipathing to me.

Now what I was after and I think I know the answer. Any way around for this? The only thing I can think of is to use the UHF side of area repeaters (UHF seems to work better with my equipment and location) and VHF on the road. Most repeaters in my area are linked pairs VHF/UHF

Isn't this many of you have already encountered? The problem with UHF in moving vehicles? I wouldn't think that I am the first if multipathing is the cause..

Thanks to all who contributed both technically and comedically.

I think what you are experiencing is the same thing I do but maybe your condition is worse for some reason.

Here is what I posted earlier today:

I have a UV-82 and UV-5R. I haven't tried either one with an external mobile antenna but I have noticed what may be the same thing or something similar to the OP's problem on both radios that only occurs when they are moving.

If the radio is moving I hear a low level crackling or rapid pulse type sound that sounds almost like a geiger counter. (If you don't know what a geiger counter sounds like see https://www.youtube.com/watch?v=upPiJ9vOYiY). It is much more pronounced on UHF than on VHF. The pulse/crackle rate increases as the speed the radio is moving at increases. It isn't normal picket fencing because it does it on extremely strong full quieting signals. I have never heard this on any other radio in over 30 years of using UHF hand held and mobile radios.

I think it maybe is SDR software artifacts from phase shifts or multipath.

I don't know if this is a characteristic of the RDA1846 chip, if it is a result poor software engineering by the manufacturer, or something else.

Tom

"Nearer TX source better, far worse.
Stronger TX source better, weaker worse."

This can be simplified to:
- Stronger signal better, weaker worse.

Sounds to me like a slow AGC circuit. The signal level is fluctuating as the antenna flexes in the wind, and the AGC circuit needs to respond quickly to keep the signal in the specified range. I don't have any actual data to support this, but that's what it sounds like to me. And, as far as I know, there's nothing you can do to a Baofeng (or any other) radio to remedy this. If that's what's happening, then... It's either a function of the design, in which case all of them will do it. Or your radio is broken. Do you have (or have access to) any other radios to use for comparison?

ANY two antennas will tend to have some influence on each other. I would suggest placing the dual band antenna centered right to left and about that same distance from either the front or back of the roof (whichever is more convenient) Put the CB antenna in the equivalent position at the other end of the roof.

The exact effect would depend mostly on the physical length of the CB antenna element, but most such antennas are not resonant at the ham frequencies you are using, so the CB antenna probably would act VERY SLIGHTLY as a reflector for the VHF/UHF antenna but with it positioned at least a half-wavelength away any effect will be minimal.

Subject: [baofeng_uv5r] Re: Tram 1185 Antenna Dilema

One other question related to this. I also have a mag mount CB antenna (yes 11 meter CB) which I would like to place on the same roof, though I assume there is the possibility of it causing reflections/refractions of my UHF signals. Is there a safe distant to separate these two to prevent any interference? I have 11 feet of roof to play with. Of course I don't want to place one on the edge and create a dead side.

I don't know if this is a characteristic of the RDA1846 chip, if it is a result poor software engineering by the manufacturer, or something else.

From: Xaun Loc
Topic: 47904 Message: 47973

When you say "the radio would still power up with... " is your radio coming up in VFO (frequency) mode or in channel memory mode????

In memory mode, the menu shows you WHAT YOU ALREADY HAVE STORED in the active memory channel -- The only way it will come up showing CT while in Memory mode is if you stored a receive tone in the currently active channel. If you don't want a receive tone (and you almost never should) you need to learn how to program the radio properly and stop setting a receive tone for the memories you save.

Subject: [baofeng_uv5r] Re: How to make my UV-5RA's R-CTCS setting persistent?

Hi Jim,

>You can change the parameters of a memory channel. You have to erase
>the channel and program it again with the new parameters.

Thanks for your reply. I tried deleting and then re-creating the memory channel, but that did not clear the fault; the radio would still power up with the "CT" icon visible at the left side of the display.

At that point, I figured it must be in some strange fault state, so I did a "RESET ALL" on the radio and reprogrammed it from scratch (using the radio's buttons, not with a USB cable), and now it is behaving the way I want it to.

Cheers,
Jeremy

It's not ignition noise. It happens even if I'm nowhere near an engine or any other electrical equipment. All I have to do is walk or hold my arm out and swing the radio around and I get a low level crackling type noise that isn't constant. It doesn't happen at all when the radio is stationary. The individual pulses sound similar to ignition or arc noise. Sometimes the pulses are spaced out and somtimes they are close together in time. It sounds amazingly similar to a geiger counter being moved back and forth over a radioactive source.

If I drank fluorescent dye that works when exposed to RF then I might
glow all the time. I'm real close to all the TV and FM towers here.
I don't know if they have anything to do with this pulse noise.
I haven't taken the HTs out away from town to see if the receivers still
suck when they are 50 miles from a broadcast station.

47980. Re: Tram 1185 Antenna Dilema

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-20 03:14:31 UTC
From: cprendon@...
Topic: 47931 Message: 47980

Another possibility at least partially is that further stations have more paths, but signal strength cannot be separated.

I tried this with BFF8+, UV82 (dare I say it in this group) and UV3R+ radios. The only non Baofeng thing I have is a Uniden Bearcat scanner, which might be interesting to try receiving with.

---In baofeng_uv5r@yahoogroups.com, <billym36@...> wrote :

"Nearer TX source better, far worse.
Stronger TX source better, weaker worse."

This can be simplified to:

- Stronger signal better, weaker worse.

Sounds to me like a slow AGC circuit. The signal level is fluctuating as the antenna flexes in the wind, and the AGC circuit needs to respond quickly to keep the signal in the specified range. I don't have any actual data to support this, but that's what it sounds like to me. And, as far as I know, there's nothing you can do to a Baofeng (or any other) radio to remedy this. If that's what's happening, then... It's either a function of the design, in which case all of them will do it. Or your radio is broken. Do you have (or have access to) any other radios to use for comparison?

On Mon, Jan 19, 2015 at 5:32 PM, cprendon@... mailto:cprendon@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com mailto:baofeng_uv5r@yahoogroups.com> wrote:
I tried a bunch of things that were suggested and a few of my own and I believe the cause is multipathing.. Here is a summary of my non-instrumental non-empirical testing. Each antenna was placed in the same position under the same conditions and compared with multiple repeaters from <1 mile to 50 miles distant all UHF from 440 - 445 and VHF 145 - 147 many linked pairs.

Nearer TX source better, far worse.
Stronger TX source better, weaker worse.
Moving even at 5mph causes problem to start.
Shorter antennas (Nagoyas) better, longer (longest is the Tram) worse. Even AV-85 on radio inside vehicle is better than Tram on roof.
Faster is worse and slower is better.
Moving to different positions on roof had no effect.
Non rhythmic noise. Unlike picket fencing. Random crackle and drops.
Antenna inside vehicle better, outside worse. (negates gain being the only factor)
VHF from same repeater, no problem.
Not related to engine speed, only road speed.

Just knowing what I do about theory (sorry my engineering background is Telecommunications as in landline), this seems to point pretty strongly to multipathing to me.

Now what I was after and I think I know the answer. Any way around for this? The only thing I can think of is to use the UHF side of area repeaters (UHF seems to work better with my equipment and location) and VHF on the road. Most repeaters in my area are linked pairs VHF/UHF

Isn't this many of you have already encountered? The problem with UHF in moving vehicles? I wouldn't think that I am the first if multipathing is the cause..

Thanks to all who contributed both technically and comedically.

Actually that does sound similar. I can get the crackling at jogging speed. It's not as frequent as when at driving speeds, but it is that kind of static. And the clicks are not rhythmic, but random. You have to get up to about 25mph before the signal of more distant repeaters starts to break up.

I'm going to try my scanner today connected to the Tram based on another person's theory that there is something about the Baofeng Radios that makes them susceptible. That will also isolate the antenna as the cause. We all know they aren't the best designs.

Now there's some important information, Tom!

Most of the inexpensive chinese radios exhibit great sensitivity but very poor selectivity, and are easily affected by weak but nearby broadband signal sources (i.e. computers... including vehicle computers), as well as very strong, more distant sources (i.e. broadcast stations). Connecting these radios to any type of better antenna in RF-rich areas often results in receiver overload/desense issues.

Try a different, higher-quality ham radio and see if it behaves the same way. Like others, I am also of the opinion that it's not necessarily a problem with the antenna.

If that was the case then the noise would appear on other receivers too.
This doesn't.

I posted earlier that I have been using various UHF and VHF radios for over 30 years and have never seen any that made this type of noise before. It is either something Baofeng did wrong or something in the RD1846 SDR chip.

I have had similar on my truck. I suspect wheel bearing noise.

I finally found it by finding a private paved lot on a hill. I turned off the engine but left all key in the ON position,to power the vehicle.. let the vehicle roll down the lot and still head the noise. That lead me to a hydraulic lift and spun the tires by hand (in neutral of course) with engine off and found rear bearing was noisy, and about to fail.

So you may want to check those bearings..
YMMV Best of success in finding the solution.

I tried it with my scanner using the Tram, it's own rubber duck and a mobile scanner antenna. Same as the Baofengs and the various other antennas. Even waving arms, it starts to become noticeable. So am I looking like one of those inflatable tall men you see in front of car lots. I did find it much worse waving arms indoors than outdoors, more things to reflect off of and weaker signal I guess.

I know the scanner has poor sensitivity. 0.4uv in this frequency range. I've never found sensitivity at freq or selectivity specs on the Baofengs but I know the scanner looses it well before the HT. I'm pretty sure selectivity is crap on these HTs.

So that seems to still support multipathing. It is independent of radio (at least the cheap ones I have), antenna (after all), vehicle/not and is dependent on speed and freq.

In the house use UHF and on the road use VHF...

Hit the road Jack...

Looking at the physical design of the antenna under discussion reminds me of a similar one that I bought from a commercial supplier a few years back. It still sits in the corner.

I wanted something low-profile with a wider SWR bandwidth but had a bad feeling about it. So, I mounted it on my ground plane fixture, a three foot square piece of hardware cloth with an old 3/4" Motorola mount in the center. I use it as a simulation of a vehicle roof, to try to determine what the real world radiation pattern and SWR performance is. By turning the antenna on its side, looking at a signal from the output of a com monitor hooked to a reference antenna, I can turn the screen and the antenna to different orientations to the signal source. It can be quite informative.

The antenna I was testing worked well on VHF but had an awfully high angle on UHF. My call to the supplier's tech department about my findings yielded a "sample" of one of their next better 2.1/5dbi co-linear guys. For FREE.

So, you might be fighting a same possibly weak signal issue here.

Stan

I don't think you need an AGC circuit for FM (unless it's in there for other modes).

I don't have any actual data to support this, but that's what it sounds like to me. And, as far as I know, there's nothing you can do to a Baofeng (or any other) radio to remedy this. If that's what's happening, then... It's either a function of the design, in which case all of them will do it. Or your radio is broken. Do you have (or have access to) any other radios to use for comparison?

Look up lightning rod. Antennas can act light them and reduce strikes by bleeding off the charge (that's how they actually work).

48003. Amazon Sellers Policies

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-20 21:46:50 UTC
From: cprendon@...
Topic: 47806 Message: 48003

This makes me wonder about something I have noticed especially in the Chinese Radio and accessory product lines. There are a number of Chinese and a few American sellers of these products who list them as both being manufactured by and the product description includes, their name. These products are obviously well known brands like Nagoya, Baofeng, Sainsonic and so forth, but they hide this in every way expect the picture. Example Seller = Aweek - product is a Nagoya NA701 antenna, but it is listed as an Aweek brand and manufacturer dual band antenna. No mention of Nagoya although that is what it is.

Are they doing this to make their product so unique in the records that Amazon cannot swap it with anything else? That way they protect their inventory from Amazon pulling from it to fill another seller's order because it is a unique product?

Sounds like a tactic that might work...

---In baofeng_uv5r@yahoogroups.com, <craig.n7lb@...> wrote :

Well, I'm replying to you as both an Amazon third-party seller AND as a buyer, whereas your knowledge of the inner workings of Amazon appears to be 100% based as a buyer. In addition, I also know 2 different folks that work inside Amazon as part of their pick, pack, and ship group who have shared various details that Amazon would prefer not to be well known to the general public (only some of which is starting to show up on various web-sites and blogs).

The various different answers we get from Amazon Seller Support (on the same question/order) are legendary, so it would not surprise me one bit that someone in Amazon customer support would try to paint the third-party seller as the bad guy during your call, with Amazon then looking like the Knight on the White Horse to you as a buyer.

Amazon is more than happy to refund your third-party order 100% (even if their FBA department screwed it up, which is why there is at least one lawsuit that I know of making it's way through the courts as we speak), after all they still charge the third-party merchant their monthly listing fees (making money), they only refund a portion of the Amazon commission fee's charged back to the seller's account (making more money), they still charge commission rates anywhere from 6 to 20% on every sale on top of their monthly fixed selling fees (making more money), and if you ship your products to the local Amazon warehouse (as a seller), they then charge you another monthly fee for storage (making more money again). As a seller, I too would be more than happy to offer a ridiculous return policy, free freight, etc. if somebody else still paid me money for each sale I refunded, especially if I alone got to decide how much money I charged somebody else on every return of their product. I'm sure you would as well.

The two biggest issues most sellers have with Amazon is that if Amazon (and Amazon alone) decides to co-mingle your product (say a UV-5R) with another seller's UV-5R units (and the other seller's units are all defective/different color, missing a item, etc., etc.), the "good" seller has no way to stop it (so the good seller may get blamed for defective product shipments), and if Amazon decides to re-ship your products to a different warehouse in another state (so Amazon can ship faster/cheaper), the third-party seller is now liable for taxes in that state (a state where the third-party seller has no nexus, did not

authorize the out of state shipments, but Amazon didn't ask).

Hopefully the courts will force Amazon to charge that policy, but just like they used an Army of lawyers to fight not paying taxes in various states for years (and finally settled for pennies on the dollar for back taxes owed years later), you can be sure that they will fight it for years into the future so long as they feel it gives them any advantage.

"Sounds like a tactic that might work..."

+++

Exactly. It's also the reason why so many different sellers ask various manufacturer's (like Baofeng) to put a different label on the same product or radio (UV-5RA, -5RC, etc.) in order to try to accomplish two different things:

First, to try to fix the various Amazon issues (for sellers) already mentioned, and
Second, to try to restore some type of pricing sanity to the products they are trying to sell by offering a "new" model that 23 other sellers aren't already selling at pennies above cost (once you factor in Amazon's monthly fees, the 6 to 20% commission rate charged to the seller (on top of the monthly selling fees), the additional FBA inventory fees, etc., etc.

48005. No waterproof compliance on these

Yahoo group: baofeng_uv5r (2015)

I realized these radios are not waterproof. Most other manufacturers are IP-X7 (submerged) or IP-X6 (splashes) compliant. It appears Baofeng may be a poor choice for bug out bags or event work because they are susceptible to rain damage.

For less than what some folks spend on one meal, I've heard these Baofeng radio's aren't D-Star, Moto-Trbo, or equipped with a built-in GPS either! Rumor has it they don't break though on many pile-ups on 20m SSB either, and do a poor job of working as a digital trunking scanner as well. Shocking, I know, after skipping that meal to pay for the silly thing.

I'll bet that when Baofeng actually meets IP67 ratings (the first few A58 radio's aren't close to that yet), those same folks will be complaining about the new programming cable required, cost of said programming cable, the lack of free Chirp programming support 24 hours after they see the radio on a website, the lack of VIP features in Baofeng's free software (compared to Chirp), or the (dare I say it) the additional cost jump of the A58 radio vs. the UV-5R.

Of course for the cost difference of a fully IP67 dual-band commercial (non-Baofeng) radio vs. the UV-5R, you could simply invest in a speaker mic (and keep the UV-5R under your jacket), or invest in a couple of plastic seal-up bags, or a $20-$25 Pelican case (that also floats) - all of which would leave you money ahead.

I've never met a real Prepper yet that didn't instantly understand the differences and features of a sub-$100 gun vs. a $1000 plus weapon, and they can usually debate endlessly the advantages/disadvantages of various caliber's, rounds available in a clip, penetration distance, etc,. etc. - yet many of them completely fail to understand the same type of tradeoffs exist in radio equipment.

Want a cheap radio? Then learn to live with and/or work around the issues you find with it. Don't keep expecting it to match up feature for feature with other radios 10x or more expensive than it is. That's just the way the world works, same way with cars, trucks, guns, etc., etc.

Yet you feel so strongly about the "Baojunk" that you just had to make a derogatory post. Well, I guess you have to justify spending what you spent on the Yaesu. And don't get me wrong, Yaesus are fine radios and without a doubt have a better quality. But not everyone needs a Yaesu.

Hey guys, thanks for the replies. I was just pointing out that the UV-5R and similar models from this vendor are not waterproof. This came to mind when I considered a survival bag and using the radio during poor weather conditions. It looks like my Baofeng can go under the jacket or in a bag as a workaround. Yes, there are more expensive models with waterproofing like the ICOM T70A or some Yaseu models. The ICOM is over $200.

I think you'll find the Icom radio you mentioned is splash and dust resistant (the IP54 standard), and not waterproof and dustproof (the IP67 standard). I have no doubt it's front-end is better than the UV-5R units and it's certainly nice to have more memories, but you'll also notice that just like the older Yaesu FT-60R it only shows one line on the display at a time, while most newer designs (including the various Baofeng, TYT, and Wouxun models) all show two frequencies at once.

Every radio owner views various features differently, so what I like you made not, and vice-a-versa, which is one of the many fun parts about any hobby. I still remember seeing a flashlight on my first Baofeng and thinking what a silly gimmick, now I'm constantly using it. It doesn't take the place of my more expensive stand-alone flashlights, and I'm not going to get a tan from it, but occasionally it's darn convenient.

I find the extended battery on my Baofeng's and TYT units to be the same, they both last so much longer on a charge I find myself picking one of those to take out for a weekend camping trip vs. the much more expensive Alinco, Icom, Kenwood, Standard, or Yaesu HT's that I own. In fact, I plan on finally taking a couple of the Yaesu HT's to this weekend's hamfest because I've simply collected way too many HT's over the years. Who knows, I may take a mobile or two to sell as well, but I'll probably end-up bringing something else home to play with, that's just the way it seems to end up.

Subject: Re: [baofeng_uv5r] No waterproof compliance on these

For less than what some folks spend on one meal, I've heard these Baofeng radio's aren't D-Star, Moto-Trbo, or equipped with a built-in GPS either! Rumor has it they don't break though on many pile-ups on 20m SSB either, and do a poor job of working as a digital trunking scanner as well. Shocking, I know, after skipping that meal to pay for the silly thing.

I'll bet that when Baofeng actually meets IP67 ratings (the first few A58 radio's aren't close to that yet), those same folks will be complaining about the new programming cable required, cost of said programming cable, the lack of free Chirp programming support 24 hours after they see the radio on a website, the lack of VIP features in Baofeng's free software (compared to Chirp), or the (dare I say it) the additional cost jump of the A58 radio vs. the UV-5R.

Of course for the cost difference of a fully IP67 dual-band commercial (non-Baofeng) radio vs. the UV-5R, you could simply invest in a speaker mic (and keep the UV-5R under your jacket), or invest in a couple of plastic seal-up bags, or a $20-$25 Pelican case (that also floats) - all of which would leave you money ahead.

I've never met a real Prepper yet that didn't instantly understand the differences and features of a sub-$100 gun vs. a $1000 plus weapon, and they can usually debate endlessly the advantages/disadvantages of various caliber's, rounds available in a clip, penetration distance, etc,. etc. - yet many of them completely fail to understand the same type of tradeoffs exist in radio equipment.

Want a cheap radio? Then learn to live with and/or work around the issues you find with it. Don't keep expecting it to match up feature for feature with other radios 10x or more expensive than it is. That's just the way the world works, same way with cars, trucks, guns, etc., etc.

From: Xaun Loc
Topic: 48020 Message: 48020

Centennial, Colorado resident Colton Ragsdale, KEØCRD, has passed his Amateur Radio Technician examination at five years of age. Colton certainly took an interest in radio at a young age! There is no age limit to taking the federal test, but it is extremely rare for anyone this young to pass it. Applicants must demonstrate an understanding of FCC regulations, radio station operation, electrical principles, and safety considerations by passing a 35 question, multiple choice, written examination. Although Colton was unable to meet the 74% threshold to pass the test the first two times he tried in December, persistence paid off as he passed the exam with a 91% on January 3 in Centennial. His parents Zeke and Debra are also both Amateur Radio operators. Colton plans to use his license for community service, particularly by providing communications for emergencies and disasters. -- Jack Ciaccia, WMØG, ARRL Colorado Section Manager

For less than what some folks spend on one meal, I've heard these Baofeng radio's aren't D-Star, Moto-Trbo, or equipped with a built-in GPS either! Rumor has it they don't break though on many pile-ups on 20m SSB either, and do a poor job of working as a digital trunking scanner as well. Shocking, I know, after skipping that meal to pay for the silly thing.

I'll bet that when Baofeng actually meets IP67 ratings (the first few A58 radio's aren't close to that yet), those same folks will be complaining about the new programming cable required, cost of said programming cable, the lack of free Chirp programming support 24 hours after they see the radio on a website, the lack of VIP features in Baofeng's free software (compared to Chirp), or the (dare I say it) the additional cost jump of the A58 radio vs. the UV-5R.

Of course for the cost difference of a fully IP67 dual-band commercial (non-Baofeng) radio vs. the UV-5R, you could simply invest in a speaker mic (and keep the UV-5R under your jacket), or invest in a couple of plastic seal-up bags, or a $20-$25 Pelican case (that also floats) - all of which would leave you money ahead.

I've never met a real Prepper yet that didn't instantly understand the differences and features of a sub-$100 gun vs. a $1000 plus weapon, and they can usually debate endlessly the advantages/disadvantages of various caliber's, rounds available in a clip, penetration distance, etc,. etc. - yet many of them completely fail to understand the same type of tradeoffs exist in radio equipment.

Want a cheap radio? Then learn to live with and/or work around the issues you find with it. Don't keep expecting it to match up feature for feature with other radios 10x or more expensive than it is. That's just the way the world works, same way with cars, trucks, guns, etc., etc.

Funny you say that. I noticed recently that the Yaesu FT1DR comes with a LED flashlight. First 'Big 4' radio to have one as far as I have seen. I checked the manual out of curiosity, and Yaesu buried the on-off switch in a menu pick somewhere, so the Chinese designs win for ease of turning on/off.

I still remember seeing a flashlight on my first Baofeng and thinking what a silly gimmick, now I'm constantly using it. It doesn't take the place of my more expensive stand-alone flashlights, and I'm not going to get a tan from it, but occasionally it's darn convenient.

How will a plastic sandwich bag seal the radio and the antenna portion? Do you plan on relying on a elastic band around the antenna to keep things water tight?

Yes, the ICOM T70A is IP54. Splash and dust. Thanks for clarifying it. I believe splash and dust is a bare minimum requirement for outdoor usage in poor weather conditions.

> On Jan 21, 2015, at 1:38 AM, Craig Carnahan craig.n7lb@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:
>
>
> I think you'll find the Icom radio you mentioned is splash and dust resistant (the IP54 standard), and not waterproof and dustproof (the IP67 standard). I have no doubt it's front-end is better than the UV-5R units and it's certainly nice to have more memories, but you'll also notice that just like the older Yaesu FT-60R it only shows one line on the display at a time, while most newer designs (including the various Baofeng, TYT, and Wouxun models) all show two frequencies at once.
>
> Every radio owner views various features differently, so what I like you made not, and vice-a-versa, which is one of the many fun parts about any hobby. I still remember seeing a flashlight on my first Baofeng and thinking what a silly gimmick, now I'm constantly using it. It doesn't take the place of my more expensive stand-alone flashlights, and I'm not going to get a tan from it, but occasionally it's darn convenient.
>
> I find the extended battery on my Baofeng's and TYT units to be the same, they both last so much longer on a charge I find myself picking one of those to take out for a weekend camping trip vs. the much more expensive Alinco, Icom, Kenwood, Standard, or Yaesu HT's that I own. In fact, I plan on finally taking a couple of the Yaesu HT's to this weekend's hamfest because I've simply collected way too many HT's over the years. Who knows, I may take a mobile or two to sell as well, but I'll probably end-up bringing something else home to play with, that's just the way it seems to end up.

> Hey guys, thanks for the replies. I was just pointing out that the UV-5R and similar models from this vendor are not waterproof. This came to mind when I considered a survival bag and using the radio during poor weather conditions. It looks like my Baofeng can go under the jacket or in a bag as a workaround. Yes, there are more expensive models with waterproofing like the ICOM T70A or some Yaseu models. The ICOM is over $200.

Especially in reviews, flaws are at least as important as features. It takes only a few seconds looking at the specs to figure out if a radio has the features you need. The flaws are more difficult to identify until SOMEONE uses the radio. When you are looking to buy a radio, some flaws may be important and some may not.

Personally, on most product review websites, I choose sort Lowest Rating First so I can see what people HATED about a particular product. I typically find that many bad reviews are posted by idiots who couldn't pour p*** out of a boot with instructions printed on the heel, but it doesn't take long to spot those reviews. But in amongst those bad reviews will be people talking about the things that interfered with their use of the product, then you have to decide whether or not those same things would be a problem for you.

"3.4% is not a major percentage of the USA."

+++

Steve, I seriously doubt the percentage is that high. If we deduct the numbers from in and around the San Francisco, CA area, you're probably well under 2% nation-wide (if that).

Or maybe it proves that if you randomly choose the answers and continue to retake the test, you will eventually luck into enough right answers to pass. In that case, no memorization at all would be required.

I have a neighbor down the road from me that got his ham license when he was 5 years old. He was considered the "worlds youngest ham" back then. He lost that title not very long after he got it when some middle eastern King granted his new born son a ham license.

My call sign is a UK call sign, but you will notice the regional identifier 'W' which shows I am Welsh and an ethnic minority myself. Cymro ydw i...

Seriously, this is all you take from my message, my lovely little UV5R sat on a SOTA summit overnight, and was still working, still had a charge, wasn't damaged, still works to this day a couple years later, and it cost a very modest sum of money. And if you know Wales, you will know that it rains here... a lot!

Great radio - great support on this forum, much of what goes on here is very positive. Jim, your efforts and input to this group is awesome. Thank you! As a still very green behind the ears amateur I value all the positive help and advice offered here.

You would think all of the hams in Tacoma, WA (like Bob) would still be happy about the Packers giving his Seahawks a greatly improbable win, but I guess not. Perhaps the various comments about the CA fruit-loops hit a little too close to home for Bob? Hopefully the moderator will simply ban him and the rest of us will be the better for it.

I don't think so, but maybe a software tech could rip it and modify it to run uv5r. mic gain, and upper and lower band limit control is useful

My wife works at O'hare Airport in Chicago, and got ahold of a number of long bags that used to be given to passengers going thru security to put their items into. They just happen to be long enough to put in a handheld radio (scanner or ht) and keep it dry. I may have a half dozen left, but we cannot seem to find them anymore.

Subject: Re: [baofeng_uv5r] No waterproof
compliance on
these

For less than what some folks spend on one meal,
I've heard these Baofeng
radio's aren't D-Star, Moto-Trbo, or equipped with a
built-in GPS either!

Rumor has it they don't break though on many pile-ups on
20m SSB either, and do
a poor job of working as a digital trunking scanner as
well. Shocking, I
know, after skipping that meal to pay for the silly
thing.

I'll bet
that when Baofeng actually meets IP67 ratings (the first few
A58 radio's aren't
close to that yet), those same folks will be complaining
about the new
programming cable required, cost of said programming cable,
the lack of free
Chirp programming support 24 hours after they see the radio
on a website, the
lack of VIP features in Baofeng's free software
(compared to Chirp), or the
(dare I say it) the additional cost jump of the A58 radio
vs. the
UV-5R.

Of course for
the cost difference of a fully IP67 dual-band
commercial (non-Baofeng) radio vs. the UV-5R, you could
simply invest in a
speaker mic (and keep the UV-5R under your jacket), or
invest in a couple of
plastic seal-up bags, or a $20-$25 Pelican case (that also
floats) - all of
which would leave you money ahead.

I've never met a real Prepper
yet that didn't instantly understand the differences and
features of a sub-$100
gun vs. a $1000 plus weapon, and they can usually debate
endlessly the
advantages/disadvantages of various caliber's, rounds
available in a clip,
penetration distance, etc,. etc. - yet many of them
completely fail to
understand the same type of tradeoffs exist in radio
equipment.

Want a cheap
radio? Then learn to live with and/or work
around the issues you find with it. Don't keep
expecting it to match up
feature for feature with other radios 10x or more expensive
than it is.
That's just the way the world works, same way with cars,

trucks, guns, etc.,
etc.

I am not sure who's comedic reply (as validated by the various smiley faces that were included to make sure it was known to be a joke) you are referring to, as there were several and you did not include a quote. If it offended somehow, than I apologize for my part. I have friends in GB and we are always comparing how our languages evolved differently after we split off. Truck/laurie, fanny pack/bum bag, nipple/teet, napkin/serviette, etc. Linguistically it is fascinating and I have no idea how cigarettes became fags or the other way 'round.

Obviously we all like our little Chinese budget radios or we wouldn't be here. But sometimes we inject a little levity to keep in fun.

Subject Re: [baofeng_uv5r] No waterproof compliance on these- tales of the radio dealer edition

With Craig’s input this just reminded me of my star customer (almost customer) at this last weekend’s show.

So here we go, gather around boys and girls and Kalifornia transgendered, Tales of the radio dealer will commence on freq and on time then back to net control.

1. Had some guy interested in a single band mobile- his eyes lite up when I told him the power was 65 W. So he wanted to know the specs on it. So I started talking about the VHF freq range top and bottom, channels capacity and other important points. The guy just kept nodding away, so I figured he understood what I was talking about so far so good. I talked about repeaters in the area and some distance checks we did earlier and contacts made. As the convo got more technical he just started saying “YEP” Will you mount it in a vehicle or use as a base? “Yep” was the reply. What antenna do you plan on using “Yep” was the reply . Finally the Yeps did not make sense with the questions so I asked him what is your call sign? Answer???? K6xxx or W6xxx or KK6 xxx nope none of those his call sign was BIG DAWG. I asked BIG DAWG? thinking the ARRL had some new vanity sign that just came out..nope I wasted 15 minutes talking to this guy who thought he was buying a CB radio !! His CB handle was BIG DAWG.

2. Some goofy guy with a serious lack of dental care kept bugging us about radios and Roswell UFO crash site. As soon as I heard ROSWELL and area 51 I sent my assistant to talk to him about getting a radio while he is visiting area 51. Jeesh the guy had a call sign too. Didn’t buy anything, drove away at least 3 potential customers too with his rambling and alien abduction stories.

3. Some woman working for ICE needed a headset with a Motorola plug, we did not have any. So looked up online a replacement for her, went real slow looking it up because it was fun razzing her on how incompetent the DHS and the idiot chief in charge is. Kind of fun doing this to one of the FEDS. Most likely we are on the Super Dooper bad boy FEMA camp list now. Gave her one of our Hillary Clinton in 2016 ZERO CENTS novelty dollar bills for waiting. Wonder where she will spend that at.

4. Same goofs that we see at every show, slightly different here though as the facility was the first we saw that had syringe disposals in the bathrooms. Figured maybe for diabetics until someone said the have a Heroin problem in the area. Which made sense with the type of clientele we saw walking around there the whole day.

5. A very attractive woman wanted an antenna high gain version for her HT. All three of us tripped over the power cords trying to all wait on her at once. Could not get a call sign or phone number either.. but lesson learned here is that THEY DO EXIST. So next time you hear a females voice wanting a radio check on those Good ole boys yellow stained underwear repeaters, it might just be her testing out that new NA771. Well worth a radio reply.

6. Had some guy telling us VN war stories after he saw our Ammo box green Go-box. Claimed he carried that exact same radio in VN, and it saved his life when a charging NVA regular charged at him with a bayonet. All good stories, however this was not a PRC 25 or 77. It was a night vision box with a Zastone UHF MP600 mobile in it. Maybe the guy was confused? Anyway we were all vets at the table and did carry the PRC25 or 77 at one time so got a chuckle from his war stories that most likely were BS. Does not even look close to a PRC 25 except we painted it OD.

7. Some guy wanted a $40 dollar uv5R, I got a few in by accident last week. So I was unloading them at the price I got them for after tax and shipping fee added up. NO PROGRAMMING included. They can get the Amazon price and same AMAZON service too. The guy wanting one moaned and complained he could buy the same one for $30 online. I explained I do not GET free shipping and have to pay taxes, and the table fee is not free. He kept complaining so I ignored him. 30-min he came back asking for a discount or some extra items. Finally he decided to buy it accepting the $10 extra over the Amazon cheapest price. That $10 must have been as severe as a watermelon bowel movement by the look on his face. After the 8th credit card that was denied, he pulled out wads of $1 bills and change with cigarette butts in it and was still short $15. He then asked if I took personal checks? I told him I remembered Baofeng tech was having a sale and he could get the latest model and a better deal from them. I hope Baofeng tech appreciates my ability to drum up business for them. Another deadbeat hopefully not on the local repeaters tonight with a new $40 radio and a $40 bottle of ripple.

Finally the customer of the day- saved for last.- Had some goofball wearing a OD boonie hat with badges and fishing lures pined all over it- that’s cool better than the MS-13 forehead gang tattoos we see at other places. Too bad not much fishing there in the desert. Anyway, he kept fooling around with the display boxes, taking batteries out, switching antennas, pushing buttons. The other guy with me yelled real loud “If you break it you bought it.” Finally, the guy said to us in the biggest Hillbilly sounding Kalifornia Fusion hillbilly accent, “Ya’all best not be sellin to dem der preppers types to be on that thar my repeater.” Figuring maybe he was an idiot and a repeater owner both, I asked him what repeater he owned? He says, “I aints gots my own repeters but sho nuff wantin to buy one.” Well ok, I figured he could be a star example to some other customers that think the Tech Class license is too hard and can only be passed by people of high intelligence. Well he walked off, 20 minutes later he came back doing the same thing. This went on for 3-hours- back and forth. Every time I saw him walking towards our table I kept hearing the “Beverly HillBillies” theme song getting louder and louder in my head. The other guys were about ready to tell him to F off. Instead, it was slow so I decided to have fun. I asked him, “Hey Jefthro when did you get interested in Ham radio? and other things like is Jed your Net control operator on the repeater you do not want anyone else to

use? or things like Where is Ellie May at today, what's her call sign? Is she at the show here with you? The guy was too slow or maybe had the first name Jefthro to get my jokes. The last time he came buy fooling with the HT display models I asked him, “Jefthro when did you guys move from Tennessee to Beverly Hills.”

You need a good sense of humor dealing with some of these characters.

48060. Using CHIRP with UV5R-2 and BF-F9V2+

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-23 00:51:51 UTC
From: jeffrey_delvecchio@...
Topic: 48060 Message: 48060

Last weekend I reprogrammed my 2 plus year old UV5R's using the latest version of CHIRP with no problems. Today I tried programming my new UV5R-2 and BF-F9V2+ and ran into the same problem with each radio. I am able to download from the radio without any problem. However, when I try to upload to the radio, the software will shutdown. I installed the most recent CHIRP and even restarted the computer. I also tried the new software with the old radios and everything worked. For some reason the CHIRP software has a problem with uploading to the new radios. Any help would be greatly appreciated. Thank you in advance.

Jeff

I can understand the problem. For a time I worked at RS and got more of the general public but some of the ones I have dealt with makes you wonder how they found the door.
 Unfortunately, they still can breed.

Bob

Which version precisely, please? The "Help -> About" menu choice will
tell you.

Many people think "Stable" means "latest", but
http://trac.chirp.danplanet.com/chirp_daily/LATEST/ is really what one
wants to use for any given programming task.

Thanks again to Dan Smith KK7DS for his tireless work and free software

So let me get this straight, I have searched many messages and references...

Chirp is designed for many types of radios so things may be odd. Checking "View/hide unused fields" helps to reduce things to the possible for this type of radio.

Chirp requires the setting of 4 codes to some number with no null number (tx-rx for ctcss and dtcs codes) even if they will not be used.

Switching the "Tone Mode" column:

(none) = no codes
Tone = just a TX code ctcss
TSQL = an RX code ctcss
DTCS = the showing of only the DTCS code and no showing of the DTCS rx code but the resulting programmend radio as I tested it seems to have the same DTCS code implemented on both TX and RX.
Cross = seems to bring both TX and RX codes into view, and the choices of which are viewed are now under the influence of another column called the "Cross Mode" column.

Changes to the The column "Cross Mode" have no meaning unless the "Tone Mode" column is set to 'cross' then the "Cross Mode" column mode entry appears magically in that row while it is otherwise dissapeared if the display "View/hide unused fields" is checked. The choices in the "Cross Mode" column now duplicate some of the choices that could have been made in the "Tone Mode" column we just set to cross to get to this new column, but more new choices of combinations of TX and RX codes become possible.

Commentators here have said that only one code will be used in a channel at a time, and that to have codes on both the TX to the repeater and the RX from the repeater requires 2 channels (the implication I guess that Dual Watch would be enabled with each channel implementing one code on Tx and RX inorder to achieve maximum quieting on both Dual Watch channels?).

However These cross settings above suggest that two codes can operate from the same channel programming, but I don't necessarily have the repeaters to test this against, or the time to try every combination.

Which permutations can any of you vouch or against with tested certainty? No I do not want to argue why you would want receive code control, I just want to document the range of possibilities and methods to implement them.

Not exactly. "View/hide Unused Fields" hides the fields that are not
being used based on the Tone Mode and Cross Mode selections.

The selection available in the Tone Mode and Cross Mode columns are
what will be changed based on the radio being programmed.

>
> Chirp requires the setting of 4 codes to some number with no null number

The radios requires 4 settings, R-DCS, R-CTCS, T-DCS and T-CTCS.

How the above work is dependent on the selections in Tone Mode and
Cross Mode. For example, when Tone Mode is set to TSQL, the ToneSql
field is used to select the TX and RX CTCSS tone. See the guides
referenced above.

The cross mode settings do not duplicate any setting in the Tone Mode
column. They expand the capability. Mainly to use CTCSS with DCS and
split CTCSS tones or DCS codes. But only if the radio being programmed
supports being programmed this way.

I have never heard anyone say this. But I've see it posted twice now.
Possibly you both times?

The UV-5R (and its many variants) can have split CTCSS tones, split
DCS codes and mixed CTCSS/DCS tones/codes in a single channel. CHIRP
supports programming it this way. Dual watch has absolutely nothing to
do with it.

>
> However These cross settings above suggest that two codes can operate from
> the same channel programming, but I don't necessarily have the repeaters to

Yes. You can program this manually using the keypad, using CHIRP or
the OEM software.

>
> Which permutations can any of you vouch or against with tested certainty? No
> I do not want to argue why you would want receive code control, I just want

I have tested only to the point that all off these possible
combinations are programmable.

Another way of looking at the Tone Mode column is that it has the most common settings (the ones that are supported the the most radios).

(None) = OFF (no CTCSS tones or DCS codes are programmed)

Tone = TX CTCSS only (based on tone selected in Tone column)

TSQL = TX CTCSS = RX CTCSS (based on tone selected in ToneSql column)

DTCS = TX DCS = RX DCS (based on code selected in DTCS Code column and DTCS Pol column

If you need something beyond what is available above, then choose Cross and then select it using the Cross Mode column.

Topic: 48060 Message: 48067

Jeff,

Shut down in what way?

Does the tab you are uploading to the BF-F9V2+ show Baofeng UV-5R or Baofeng BF-F8HP?

It must say BF-F8HP to be uploaded into a BF-F9V2+ radio. You must download from the radio using the BF-F8HP as the model selection, edit as needed and then upload.

You cannot/must not upload a CHIRP Radio Image (*.img) file from a UV-5R into a Baofeng radio with 3 power levels. You also cannot/must not upload if the source .img file is from a radio with BFB or BFS firmware and the destination radio has N5R firmware. Uploading one onto the other is a definite no-no. The latest daily build prevents this and you should be happy that it does.

If you want the channels from your UV-5R radios in your BF-F9V2+, you have to import them into the BF-F8HP tab. Then upload to your radio.

File -> Import -> change file mask to "CHIRP Radio Images (*.img)" and then import the .img file from your UV-5R.

How do we get the developers to fix CHIRP so all the tone modes for the FT-7800R are supported?

I manually programmed my FT-7800R with each of the different CTCSS, DCS and split mode combinations that the menu allows.

When CHIRP downloads from the radio everal channels have errors. I can supply a CHIRP radio image and a FTB7800 radio image if necessary.

Mike,

It comes off pin 22 of the 1846 to control the PA power levels outside the chip. The PA gets the RF out from the 1846 and then the controlling bias from the pin 22 output to set the rf amp levels.

This was a firmware tweak for the Tri-powers where they must have selected a Mid binary chain for a mid power setting. Chirp does a L or a H setting for it.

here some more

RF input and output

The chip can receive and transmit RF signals from 400 to 500MHz and from 134 to 174MHz which cover most of the walkie-talkie frequency bands around the world and the weather broadcast band. For the RF input, a direct-in connection from the antenna to the LNA input pin through a switch is suggested which means no input impedance matching is needed for the receive band. For the RF out, a pa diver can deliver no more than 8 dBm power to PA. PA bias voltage from 1.5V~2.8V for the power amplifier can be supplied from the PABIAS pin.

The

thank you Jim, that is a very nice spreadsheet summary, best piece of chirp B5 clarity I have seen. I have attached a "buttons" single page cheat sheet/model comparator that may be useful in managing a mob of radio users, especially if the radios are preprogrammed for some low power/narrow/TX blocked defaults that might have to be temporarily changed.

I may try to address things in this way

Separate Dummy chirp files that lists all the hypothetical permutations in implementation for:
A. Simplex, presenting low power and narrow as more legal/stealthy/heat/battery saving urban starting options and tx default blocking for FRS 1/2 watt channels, some scan channels, skip scan busy noisy channels.
B. Repeater with no Receive code blocking/squelch
C. Repeater settings with Receive code blocking/squelch

"B. without recieve blocking" does seem the best way to start experimentally interrogating repeaters under test. The DTCS repeaters published in mygmrs.com have been the most difficult for me, it appears the cross mode must be used to defeat DTCS recieve code blocking/squelch. Then I suppose I could test the 4 permutations of DCS polarity (or just 2 if recieve tone is defeated in cross mode? the first letter is TX?).

The use of recieve codes has been argued as usefull for engine noise situations, avoiding false flag transmissions , but the Uv method of squelch still seems to put the reciever into receive function mode as if it was recieving except that you cant hear it. This means the Dual Watch will be flip flopped, and you might be prevented from doing something untill you figure whats going on and defeat the reception mode. So you can block annoyance at the cost of losing potentially usefull receptions, the ability to transmit, and general situational awareness.

Jeff,

There are several CHIRP users with Mac computers that are having issues right now. I'm not a Mac person so I can't help you there. The error that I was talking about shuold not cause CHIRP to close like this.

What I might suggest in the short term would be to use CHIRP Live CD. You can 'burn' it to a USB flash drive with unetbootin and then boot from it. I don t know of any Linux users that are having a problem like this.

Then you should be able to find a Mac user that has already reported a similar occurrence and add your update to it.

Do you have a pace-maker? When you swing the radio around does a crop circle appear? :P-
Joe
---In baofeng_uv5r@yahoogroups.com, <nd5y@...> wrote :
It's not ignition noise. It happens even if I'm nowhere near an engine
or any other electrical equipment. All I have to do is walk or hold my
arm out and swing the radio around and I get a low level crackling type
noise that isn't constant. It doesn't happen at all when the radio is
stationary. The individual pulses sound similar to ignition or arc
noise. Sometimes the pulses are spaced out and somtimes they are close
together in time. It sounds amazingly similar to a geiger counter being
moved back and forth over a radioactive source.

My father in law is 86 and has just had a heart pacemaker fitted. I've been told that using a radio such as the UV5RE near him could play havoc with his heart. I've no desire to see the old chap explode just because I am using a radio so can anyone here help me out? True or false...this radio kills old men.

Did you read the page?

St Jude says "We don't anticipate any interaction" – a qualified "no"

The AHA says "in general, have not be shown to damage…change pacing rates…totally inhibit" – a very qualified "no"

And Cardiology Associates who appear to be out of business says "Avoid" and "keep at least 6 feet away". Most definitely not a "no".

And Boston Scientific – a place that actually makes these things says 24" for CB and police radio antennas – see page 60 (I think you can read that as 5W)

http://www.bostonscientific.com/content/dam/Manuals/us/current-rev-en/356430-007_CRT-P_PH_en-USA_S.pdf

Check with pacemaker manufacturer and doctor. Never heard of two way radio interference with medical devices. Still, check with the appropriate people. The your mileage may vary clause here is not appropriate.

After 20+ years working on an ambulance I have never heard of this one
and I have taken my share of HAM's into the hospital over the years.
Their gear ranging from simple handhelds up to massive HF rigs and antennas.

I'm not sure where you heard that from but consult with his cardiologist
who put that pacemaker in to verify. You can also look on his pacemaker
card for the manufacturer and model of pacemaker and consult with them
directly.

Not a ridiculous notion at all. Perhaps overblown by the media and an infinitesimally small risk. Good thing we don't buy pacemakers like we do radios J

Jeffrey Silderberg did a report in 1993 that specifically listed an EMT radio transmission causing excruciating pain to the patient for example:

And, of course, these are only reported incidences…how many have slid by without anybody knowing what caused it?

http://www.fda.gov/downloads/MedicalDevices/DeviceRegulationandGuidance/GuidanceDocuments/UCM072177.pdf

On the other hand, SIlderberg didn’t' exactly have a boatload of examples. It would appear the risk is quite small and no doubt devices are tested better now than they used to be.

In 1993, medical equipment wasn't shielded like it is today. Like I said, I've worked in Hospital IT, and we had to test any radio equipment before it was allowed to be used in the hospital. We found no issues with modern 2 way HT's, WiFi, Cellular, etc. weith either medical equipment connected to a patient, or embedded in a patient.

From: Gary D. Schwartz
Topic: 48089 Message: 48103

This is completely accurate for the USA. The US Citizen's Band is in the 11 meter range, and using AM instead of FM, completely different from anything the Baofeng is designed for.

However, there is an Australian citizens band in the UHF range. IT is not legal as I understand from previous postings from Australians here, but may be technically possible.

A single $40 radio that receives and transmits on every frequency and mode?

Unless your father-in-law's doctor got the pacemaker on eBay from a Chinese factory that cuts even more corners than BaoFeng it is VERY unlikely that the radio would have any effect whatsoever on the pacemaker.

IF radios were any danger to the pacemaker the doctor would have warned your father-in-law. That information would also be in the pile of paperwork that the hospital gave him when they sent him home.

If you need to reassure yourself, or anyone else, have a chat with his doctor.

5 watts at UHF/VHF? There will be all kinds of theories and studies. I would just ask yourself if it is worth the risk even if it is 1,000,000,000:1? Just keep ANY transmitter a fair distance away. Power decreases exponentially with distance so it doesn't have to be that far. Just don't stand next to him with a transmitter when keying up. There are too many variables with all the different kinds of transmissions and harmonics to study and validate ever possibility.

I have worked around all kinds of technology my whole life and seem some pretty bizarre things happen around transmitters even cell phones, in places like computer rooms and medical labs.

That's my 2 cents worth anyway.

Hi, when in alarm mode you can set it to transmit 5 tones followed by morse.
Does anyone know what the morse is that it transmits & if it can be changed?

Cheers,
Matt

Scanning is started by a long press of the [*SCAN] key. It takes about 2 or 3 seconds. As far as I know the long press time is not adjustable. The short press of the [*SCAN] key activates "reverse" mode.

No one anywhere is ever going to guarantee that anything bad will never happen. You will never get any medical professional to publicly guarantee that the oxygen molecules in a room won't randomly happen to ALL move to the other side of the room causing you to asphyxiate due to lack of oxygen where you happen to be standing.

Many hundreds of hams have pacemakers - modern pacemakers are designed to operate in the modern world - a world where you are constantly exposed to significant levels of RF energy. The 24 inch separation recommended by Boston Scientific is meant to be an ultra-safe precaution, which makes sense given the potential seriousness of a pacemaker malfunction. So, yes, Larry should not place the antenna of his radio against his father-in-law's chest while transmitting, but in the real world that should not be an issue.

I don't think my HT has ever been within 24 inches of anyone's chest other than my own while transmitting.

Did you read the page?

St Jude says "We don't anticipate any interaction" – a qualified "no"

The AHA says "in general, have not be shown to damage…change pacing rates…totally inhibit" – a very qualified "no"

And Cardiology Associates who appear to be out of business says "Avoid" and "keep at least 6 feet away". Most definitely not a "no".

And Boston Scientific – a place that actually makes these things says 24" for CB and police radio antennas – see page 60 (I think you can read that as 5W)

MANY years ago, microwaves were a potential problem if the door was not properly sealed. Two-way radios were also a potential problem many years ago. Pacemakers and other implanted medical devices have improved over the decades since then. Many of the old warnings are still posted in businesses because no one dares take the chance of removing any warning about anything.

The advice from the manufacturer is ultra-safe but probably the best advice available.

I've seen where a cell phone can and did mess up a wireless lapel microphone system.

The morning's speaker had the phone in his breast pocket, its repeated bursts of RF got into the mic input circuitry. Good old "Pin 1 problem".

Besides messing up the recording I was making the thunder crashes made by the digital phone's signal woke up several of the folks in the audience.

Of course, it was all the sound man's fault.

Now I request (demand nicely) that guest speakers turn off their phones or leave them with another member of their party.

Stan

If your country's CB channels are within the transmit range of the UV-5R
and use FM then technically you can program the channels in.
It is possible in Australia however the it is not legally permitted.

Regards,
Chris

No way to adjust the time for ANYTHING. What you see is not really the delay before scanning.... You see the time it takes the software to decide that you are holding the key, not just pressing it, THEN the time it takes to decide there is no signal on the current active channel before it moves on to the next channel. Once you see the scanning begin, you will notice that it takes a LONG time on each quiet channel before it goes on to the next channel, and if it stops on an active channel there is an even longer delay after the signal drops before it moves on to the next channel. These radios have a capability to scan, but they will never be a suitable replacement for a real scanner.

it is absolutely useless unless you happen to be operating on an system that uses ANI (automatic numeric identification) _and_ includes a function to recognize the emergency code. I have never heard of ANI being implemented on any amateur radio system and it is rare on commercial systems. ANI had a brief period of popularity on public safety systems in the US (and perhaps elsewhere) as an component in some early dispatch systems.

Hi There is a known problem with the latest Mac OS and Chirp.I upgraded the OS and now have the problem myself.NEVER had any problems before the upgrade.Waiting patiently for the answer.
I wish I had not upgraded for several reasons besides the Chirp problem.Only did the upgrade so that I could run a video editing upgrade grrrrrrrrrrrThe problem seems to be that Chirp does not select (or display a choice) of a USB port.
If anyone knows the answer or has a work around could they please share it.
Thanks.

I actually found something that seems to work very well for $8. I am running RG58/U from the antenna (50'). When I transition to the window-thru I use a SO239 to BNC adapter and then a 6 inch BNC to BNC jumper cable made of RG174 (50 ohm) around the window. Then I have a 12' RG58/U BNC cable to my radio with a BNC/SMA adapter.

I am sure that the short RG174 jumper creates a theoretical additional loss in the feedline, but I cannot tell it in actual performance compared to a 50' + 18' RG58/U PL259 cable set without the jumper.

Why not just do something like in the picture. You can make it out of wood, metal, or some other material and come up with a way to block the window from opening from the outside if it is at ground level. You can also purchase panels like this for around $70 if you want to spend the cash.

RG8, 8X, and even crappy radioshack coax is ok for HF work but I would not use any of that for VHF or UHF work. 9913 or LMR400 has a higher cost, but by the time you mess around with adapting everything to your radio, the total cost will be close enough to justify the improved signal strength.

My definition of improved tx signal is 2 to 3 bars to the average receiver. If all of your contacts are only a mile or 2 away, then quality coax won't matter. But if you are trying to talk simplex or hit repeaters 15 miles away, it matters, especially on 70cm with 4 to 5 watts.

The short answer to the original question is that you will not likely do any harm to anything other than your tx signal because the SWR will go up a bit. At 5 watts this isn't going to hurt the radio, but most of your signal will not leave the antenna.

A word to the wise... RG58 is probably the WORST cable you could use
for a 50' run with a VHF/UHF radio. The VHF might work somewhat, but I
doubt that your UHF performance would be acceptable. As someone else
mentioned, use the highest-quality coax and antenna that you can afford
or you'll just end up spinning your wheels.

Date: 2015-01-26 18:07:10 UTC
From: Michael Black
Topic: 47666 Message: 48130

Well…it's a 62ft run…50+12…58/U loss at 100Mhz would be ~2.4dB, loss at 400Mhz ~5.2dB.

http://hamradio.arc.nasa.gov/coaxcableloss.html

5W VHF would become ~3W

5W UHF would become ~1.5W

Path loss formula is

PL = 117 + 20*log10(F) – 20*log10(Ht*Hr) + 40*log10(D)

Where

PL = path loss in dBm

F = Freq in MHz

Ht,Hr = height of tx and rx antennas (feet)

D = distance between antennas (miles)

Assuming 25 foot Ht and 5 foot Hr effective range reduction due to cable loss alone would then be about 15% for VHF and 35% for UHF.

Not quite as bad as one may think. On UHF your 34 mile range would reduce to 25 miles. On VHF you'd reduce to 29 miles.

Not true.

1 milwatt is 0 dBm

1 watt is 0dBw or 1000dBm

dBm and dBw are absolute values.

If I say to you it changed 10 db that only has meaning if you know that we are talking about dBm or dBw .

A 5 watt transmitter is ~ +36dBw but it is also +36000dBm.

A small thing but we need to be correct if we are to communicate the facts.

Cheers

Gord

Subject: RE: [baofeng_uv5r] Re: Antenna Cabel Guru Needed

Well…it's a 62ft run…50+12…58/U loss at 100Mhz would be ~2.4dB, loss at 400Mhz ~5.2dB.

http://hamradio.arc.nasa.gov/coaxcableloss.html

5W VHF would become ~3W

5W UHF would become ~1.5W

Path loss formula is

PL = 117 + 20*log10(F) – 20*log10(Ht*Hr) + 40*log10(D)

Where

PL = path loss in dBm

F = Freq in MHz

Ht,Hr = height of tx and rx antennas (feet)

D = distance between antennas (miles)

Assuming 25 foot Ht and 5 foot Hr effective range reduction due to cable loss alone would then be about 15% for VHF and 35% for UHF.

Not quite as bad as one may think. On UHF your 34 mile range would reduce to 25 miles. On VHF you'd reduce to 29 miles.

Agreed. RG58 is a poor choice for a 50' run at VHF, and a VERY poor choice at UHF. RG6 should be the minimum.

No, it is correct but we must never use db without qualifying it as in it's own it has no meaning other than to express a value in a log scale.

However when we say dBm or dBw we have stated a measurable, repeatable reference value.

So path loss is a relative measurement in dB to show a loss of power in a log scale.

We must also not lose the connection between liner power measurement and log power measurement.

This part is correct:

1W = 0dBW = 30dBm

5W = ~3.7dbW = ~3700mW = 37dBm

1W does not = 1000dBm. 1000dBm is 1E97 Watts. I'm not sure that even the sun puts out that much power.

dB is relative level to another signal, typically an input signal or another output.

OK. I looked up the power of the sun. It's 3.846×1026 W. Or 295.85 dBm.

Billy KF4ECB

From: lewsoloway@...
Topic: 48141 Message: 48141

I'm trying to program my new phone. I've gotten Chirp uploaded with a template, modified, and an image uploaded back to the phone. But, I can't seem to get it to transmit.

I'm wondering if I am putting in the wrong offset frequency. If I'm on the 70cm band, do I put in the 005.000 offset in menu #26, or do I put the full frequency in, say 440.000 for a repeater frequency of 445 (assuming - is the proper sft-d)?

Also, what I put in in frequency mode, doesn't get saved in channel mode.

If you could point me in the right direction, I'd appreciate it.

Thanks,

Lew, KK6QJE

It's a two-way radio, not a phone.You can not talk and listen at the same time.

Lew,

I'm a little confused as to your question. You talk of using chirp, but then you discuss VFO, menu options, etc etc.

Here is an excellent place for you to start.
http://www.miklor.com/uv5r/

That site is the BEST for the UV5R. I am assuming you are new to ham radio, so I'll point you in the right direction. After reading through the miklor site, try what they suggest.

The only way to figure it out is to read and learn, then ask questions.

Probably their issue of one of several new products?

BF-F9+, BF-F3+, UV-TEN4

http://www.baofengradio.com/en/shownews.asp?id=33

http://baofengradio.us/baofeng-bff9v2-black.html

GT-1 or GT-5? (Baogeng's news was a bit indecisive but radioddity has them)

http://www.baofengradio.com/en/shownews.asp?id=33

http://www.radioddity.com/us/baofeng-gt-5-two-way-radio-dual-band-vhf-uhf-13
6-174-400-520mhz-daul-ptt-earpiece.html?gclid=CPqG8_PUssMCFQ4BaQodmigAvw

All-in-all probably not too exciting.

Probably something like the A58 model (or some version of it) being available (with the implication that they have some exclusive on it too).

From: cprendon@...
Topic: 47666 Message: 48151

Thanks to all for all the theory. Here is the real world of what happened:

Compared to my 4/5W HT inside my wood frame stucco house I have reaped a HUGE improvement in UHF/VHF with this cable rig from same UV5R/UV82 HT to an Ed Fong DBJ1 J-Pole at 15' high. As to why I don't spend a lot more for a much better rig, I haven't needed to. I can TX and RX clear to repeaters in excess of 45 miles away (2,500' altitude) in both bands. Some of which I could barely get a readable TX out before. If I can hit and receive with full quieting everything in my area, what more do I need if I am not heating the heat sink...

The only issue I noticed is when experimenting with various cable combinations, when I hit 75' of RG58 I lost my 444 repeaters COMPLETELY. That is too much RG58 anyway and more than I needed. Just had a 25' cable to try on the end of my 50' (plus 6") and found some repeaters went dead both TX/RX. I am guessing it has more to do with wave length:cable length than loss, because the crash was so sudden and only at a narrow freq range, but may be wrong. Shortening cable from 75' to 62' made everything come alive again.

I have 36' of RG8 on the way to replace the 50' of RG58 which may help as long as there isn't a problem transitioning from RG8 to RG58 at the 36' point (from antenna) in the feedline of 48'. The 50' RG58 was just something I had around from my CB days. I know, that will start another flurry of theory discussions. Will let you know how it works though.

So it's the old "If it ain't broken, don't fix it."

I guess that will bring a whole new series of modification questions, like "how come I can't hear my CB with a 100 watt linear on this radio?" I'm sure Rich will be busy at his booth once those radios start shipping in quantity....

Larry,

The UV-5R variant radios do not use shift direction or offsets for memory channels. Instead, the RX and TX frequency are use (2 things instead of 3 is more memory efficient).

Menu 25 (SFT-D) and menu 26 (OFFSET) are only useful in VFO mode.

CHIRP lets you program using the RX frequency, the shift direction and offset, but uses them to computer the TX frequency. Then it send the RX frequency and TX frequency to the radio since that is what it uses.

You can attach you CHIRP Radio Image (*.img) file (or email it to me direct) and we can take a look at it for possible problems.

Subject: Re: [baofeng_uv5r] Re: Antenna Cabel Guru Needed

Thanks to all for all the theory. Here is the real world of what happened:

Compared to my 4/5W HT inside my wood frame stucco house I have reaped a HUGE improvement in UHF/VHF with this cable rig from same UV5R/UV82 HT to an Ed Fong DBJ1 J-Pole at 15' high. As to why I don't spend a lot more for a much better rig, I haven't needed to. I can TX and RX clear to repeaters in excess of 45 miles away (2,500' altitude) in both bands. Some of which I could barely get a readable TX out before. If I can hit and receive with full quieting everything in my area, what more do I need if I am not heating the heat sink...

The only issue I noticed is when experimenting with various cable combinations, when I hit 75' of RG58 I lost my 444 repeaters COMPLETELY. That is too much RG58 anyway and more than I needed. Just had a 25' cable to try on the end of my 50' (plus 6") and found some repeaters went dead both TX/RX. I am guessing it has more to do with wave length:cable length than loss, because the crash was so sudden and only at a narrow freq range, but may be wrong. Shortening cable from 75' to 62' made everything come alive again.

I have 36' of RG8 on the way to replace the 50' of RG58 which may help as long as there isn't a problem transitioning from RG8 to RG58 at the 36' point (from antenna) in the feedline of 48'. The 50' RG58 was just something I had around from my CB days. I know, that will start another flurry of theory discussions. Will let you know how it works though.

So it's the old "If it ain't broken, don't fix it."

Billy,

That "small business" (Baofeng Tech) supposedly located in South Dakota is the street address for the local Post Office. Several folks at UPS (near their "location" in a tiny town South Dakota) have never heard of them, no one in the local Chamber of Commerce has ever heard of them, and no one at the South Dakota tax department has ever heard of them, so it's quite possible (perhaps even likely?) that Baofeng Tech is a front located elsewhere. All orders are shipped via Amazon via the FBA (fullfilled by Amazon) seller system, so the company could just as easily be located overseas as anywhere in the U.S.

Another company (SainSonic) hires part time folks in the U.S. to handle things like support issues (so that they have someone who a) speaks English, and b) is in a relatively close time zone (as opposed to half a day of more difference) - but that doesn't make SainSonic a "local" company, and in fairness they don't claim to be.

You can get a phone number listed anywhere in the country via AT&T (florists do it all the time) - which fools some people into thinking you're local when you're not.

From: brian@...
Topic: 48182 Message: 48182

I am having a big issue with my BF-F8HP. What is going on with the radio is this. Every so offten I get a ton of static on a frequency. We have one where the radio breaks squelch several places in my house. This i can understand but what I have a hard time with is when i am outside with nothing around and the radio breaks squelch with nothing but static. The static is constant and very loud. It can be intermittent but most of the time it the radio needs to be touched or moved.

I have a couple of different radios a Kenwood tk-2180, icom F-50 and the Beofeng BF-8HP. only the beofeng breaks squelch. why is that and what can i do to make it stop?

48183. Re: [baofeng_uv5r] Re: Antenna Cabel Guru Needed

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-27 23:19:02 UTC
From: Craig Carnahan
Topic: 47666 Message: 48183

It's really all a question of does the extra height, the antenna being outdoors, and the gain factor of the antenna (if any) have enough additional performance to offset the loss of the cable type selected and any additional connectors or patch cables used in the installation (both of which cause power loss - some more than others).

Repeaters (typically) have a far better range and selectivity than any Chinese handheld (especially the UV-3R and UV-5R series radios), which allow the repeater to pick up a really weak signal and re-broadcast it.

Since the Baofeng radios have no real S-meter (it's always 5 bars if it shows anything at all), many folks mistakenly think their new outdoor antenna installations have dramatically improved their signal (and sometimes it has), but a better test is to work folks (at various distances) on simplex instead. These folks need to have a radio that actually has an S-meter (even if it's not perfect, so long as it shows a variety of signal strengths it's ok for this simple test).

If your maximum distance on simplex used to be 3 miles at S-1 (example only) and now you can work 6 miles at S-1, your antenna has helped, but if you want to see how much (short of spending a while trying various distances), climb the tower with your handheld, try to contact your friend and compare the difference your new antenna/coax combo is actually making vs. simply using your HT at the same height.

Can't climb a tower, or using a pole instead? Well, you could jury-rig a bag (that holds the ht with a small battery) to the pole and tape the PTT to transmit (perhaps on low power, I would not suggest you leave it up there for very long, as the radio will get warm), then quickly get it up to the maximum height, get a good reading from your friend, and carefully lower it back down to ground level (this should not take more than a minute or two). After attaching your "new antenna", coax, etc. to your pole, go back inside and (at the same power level you used previously), re-do the test and compare the signal strength.

Admittedly, this is a "hillbilly" like test, but there's simply no getting around the fact that various types of coax, the length of that coax, the number and type of jumpers (50 ohm vs. 75 ohm for example) used in the antenna installation all eat up power while it's making it's way up to the antenna, in addition to the frequencies used.

UHF power loss is far greater than VHF, and VHF power loss is far greater than HF, especially when you're trying to keep costs down by using RG-58 or RG-8X. If RG-8X (or similar cheap coax) was 95% as good as LMR-400/600 in the VHF/UHF frequency ranges, Belden, Times/Microwave (and others) would have a very hard time indeed of selling much of it.

If you are going to spend the time anyway to put up an outdoor antenna and try to squeeze every last bit of additional signal available from a 4 to 5 watt radio, I'd suggest eliminating as many jumpers as possible and using the best level of coax you can afford, especially if the run is over 50 feet, you plan to work UHF, or you discover that many folks still use simplex not just repeaters. Of course if the entire budget (radio, antenna, coax, tower poles, etc.) is $100 or so, you're going to have to cut corners somewhere, just understand that if you end up using RG-58 or RG-8X on your 50 ft. cable run, it is having an impact on your VHF/UHF signal, no two ways around it.

The simple answer (short of putting a PL tone on the incoming signal) is to use a better radio. Baofeng radios are known to be as wide as a barn door on receive, that's just one of the many reasons it's a $60 radio.

With the expense of ammo nowadays, perhaps the last page of the Detroit or Chicago manuals could be a small paper target?

48187. Re: [baofeng_uv5r] Re: Antenna Cabel Guru Needed

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-28 00:20:27 UTC
From: cprendon@...
Topic: 47666 Message: 48187

WOW! Very creative and clever.

Yes, there are so many factors and I do have a limited budget. That's why I am just trying to get any improvement any way I can. The antenna definitely has more gain than a rubber duck inside and the 15'+ height certainly helps. Most likely they more than offset any cable loss. I am trying to keep connections to a minimum and only using 50 ohm cable to keep the impedance matched at least.

I'm sure that the gains just outweigh the losses compared to a rubber ducky indoors. Same radio in all cases.

If I had a $900 base station and an antenna tower things would be different. But a $25 J-Pole on some PVC tied to a volleyball pole using a Chinese HT.....

I will try the simplex distance comparisons just out of curiosity. I have a setup I use that involves a phone in front of a radio at home and my cell dialed to it while TXing from the car driving around. Hey, it works... ;-)

---In baofeng_uv5r@yahoogroups.com, <craig.n7lb@...> wrote :

It's really all a question of does the extra height, the antenna being outdoors, and the gain factor of the antenna (if any) have enough additional performance to offset the loss of the cable type selected and any additional connectors or patch cables used in the installation (both of which cause power loss - some more than others).

Repeaters (typically) have a far better range and selectivity than any Chinese handheld (especially the UV-3R and UV-5R series radios), which allow the repeater to pick up a really weak signal and re-broadcast it.

Since the Baofeng radios have no real S-meter (it's always 5 bars if it shows anything at all), many folks mistakenly think their new outdoor antenna installations have dramatically improved their signal (and sometimes it has), but a better test is to work folks (at various distances) on simplex instead. These folks need to have a radio that actually has an S-meter (even if it's not perfect, so long as it shows a variety of signal strengths it's ok for this simple test).

If your maximum distance on simplex used to be 3 miles at S-1 (example only) and now you can work 6 miles at S-1, your antenna has helped, but if you want to see how much (short of spending a while trying various distances), climb the tower with your handheld, try to contact your friend and compare the difference your new antenna/coax combo is actually making vs. simply using your HT at the same height.

Can't climb a tower, or using a pole instead? Well, you could jury-rig a bag (that holds the ht with a small battery) to the pole and tape the PTT to transmit (perhaps on low power, I would not suggest you leave it up there for very long, as the radio will get warm), then quickly get it up to the maximum height, get a good reading from your friend, and carefully lower it back down to ground level (this should not take more than a minute

or two). After attaching your "new antenna", coax, etc. to your pole, go back inside and (at the same power level you used previously), re-do the test and compare the signal strength.

Admittedly, this is a "hillbilly" like test, but there's simply no getting around the fact that various types of coax, the length of that coax, the number and type of jumpers (50 ohm vs. 75 ohm for example) used in the antenna installation all eat up power while it's making it's way up to the antenna, in addition to the frequencies used.

UHF power loss is far greater than VHF, and VHF power loss is far greater than HF, especially when you're trying to keep costs down by using RG-58 or RG-8X. If RG-8X (or similar cheap coax) was 95% as good as LMR-400/600 in the VHF/UHF frequency ranges, Belden, Times/Microwave (and others) would have a very hard time indeed of selling much of it.

If you are going to spend the time anyway to put up an outdoor antenna and try to squeeze every last bit of additional signal available from a 4 to 5 watt radio, I'd suggest eliminating as many jumpers as possible and using the best level of coax you can afford, especially if the run is over 50 feet, you plan to work UHF, or you discover that many folks still use simplex not just repeaters. Of course if the entire budget (radio, antenna, coax, tower poles, etc.) is $100 or so, you're going to have to cut corners somewhere, just understand that if you end up using RG-58 or RG-8X on your 50 ft. cable run, it is having an impact on your VHF/UHF signal, no two ways around it.

From: dg1bgs@...
Topic: 48197 Message: 48197

Hi all,

I've got my GT-3 Mark II couple of weeks ago. I found there is a problem with the battery. I've charged it until the battery was completely charged before I used it for the very first time. The hand-held worked very well, but when I didn't used it for a couple of days I found that I couldn't switch on the hand-held. After I charged the battery again (I took 5-6 hours) the device worked well again. But even if I don't use it the battery will be completely empty after 2-3 days.

I already got a second battery but this didn't fixed the problem. Maybe there is a short circuit in the hand-held which discharges the battery even if it is completely switched off?
Does anyone else had the same problem and got it solved?

There's no reason your battery should behave like that with a good radio.

Send it back.

Hi Stephan -

I've had similar issues with several different chinese radios. Apparently, some radio models continue to draw current even when switched off (possibly for the microprocessors). I dealt with it by simply removing the battery when I expect to not be using the radio for a time. The batteries seem to hold a charge very well when not connected to the radio.

This does happen on devices that don't really have a power switch. Most tech devices now just have a status switch (cell phones as an example) which leaves the microprocessor and RAM alive and running sensing when the switch is depressed in such a way to signal it to start, usually a three second hold. But even then the battery usually lasts weeks when the device isn't used for awhile. I have only seen pictures of the GT3 but my understanding is that it is just another second generation UV5R variant inside and as such should have a true power switch.

I have to agree with the others. Sounds like it's an issue with the radio. I own two of the GT-3 Mark II radio, and I haven't experienced this problem with either of them. Mine can remain off for weeks at a time and still power up when turned on. I'd definitely send it back.

Then there is the interesting relationship between Baofeng USA (http://baofengradio.us/about) http://baofengradio.us/about and Foscam which they state is their owner/operator. I ordered a battery from them and all the paperwork that arrived with it was Foscam. No reference to Baofengradio at all.

---In baofeng_uv5r@yahoogroups.com, <doopsnoop@...> wrote :

Radio Oddity is a offshore business that is for certain. Now Baofeng tech is slightly more tricky, they do have colloquialism writing patterns that I saw with Non Native English writers, or ESL Chinese students that attended US Universities.

It might be a good bet that Baofeng Tech is operated under an EB5 Visa setup. We have a large number of them around here where I live. We are talking radio/electronics logistics areas to Solar Panel outfits. When the students finish their university studies a quick way is to apply for an EB5 visa. They need to invest in a business startup with certain rules and regulations that the idiots in our government do not enforce just like immigration. The morons of the DHS are in charge of this program which makes it worse. So the businesses often are fronts for various illegal activities and shady dealings. At the very best they use them to transport large sums of Chinese corruption money from that regime to the families of CCP members involved in corruption. Their children stay here and run the businesses with money funneling in. Have you guys ever been in houses worth more than 5 million? I have, and some are bought as gifts for their 24-year old recently USC graduate kid. That is how much money is rolling into this area from PRC. I see Bentley’s, Ferrari’s Lamborghini’s often driving around here locally, even a classic Rolls Royce is seen driving around in my town. These noticeable cars are often driven by younger Chinese kids of the EB5 families or government officials of the CCP. Google zipcode 91709 and you can read all about it.

The Chinese even have names for these people “Nude Officers” or Shanxi mei lao ban.

While I am NOT saying that Baofeng Tech are really Chinese , I would not doubt there is a strong connection to China and it is always possible that this company is actually a Chinese based one in the USA falling under EB5 guidelines and running out of a POB from North Dakota from a town of 2000. I am NOT claiming this to be true, however in recent years more of these companies are popping up. So competitors do have the rights to be suspicious if or if not this is the case.

While nothing is wrong with this as long as the promises are met and products are of good quality (which they are from Baofeng Tech). However, from other radio dealers they will become suspicious on certain claims (knowing the business) and do some research detective work. That is where Craig a radio dealer, might have found when doing some research about various companies.

Now I have seen a few companies doing the same, companies claiming to be RED WHITE and Blue but actually companies operated from China with a few token US native born staff to take phone calls.

So Craig is not paranoid but just calling them as he sees them and there is a large amount of truth to his observations.

Hi Mark,

Which version of CHIRP?
Which computer operating system?
Which device driver for the programming cable?

The text in the BaofengTech About Us page includes plenty of errors and strange grammar choices but I've seen plenty of US high school grads who wouldn't do as well. BUT personally I am suspicious of any online vendor who has to hide behind a FAKE physical address.

Are you talking about baofengtech: https://baofengtech.com/about - if so I must be missing the Chinglish referred to? If you meant radioddity: http://www.radioddity.com/us/about-us I would definitely agree that they have some chinglish issues going on.

Phone, used that way, is a MODE, but it is NOT a piece of hardware. PHONE as a piece of hardware is the device that you connect to the Public Switched Telephone Network (although some people do misuse the word phone to also include a cellular or PCS device)

Voice communication on HF is often referred to as "phone" as opposed to CW.

Long ago I used to have a FFL (USA - Federal Firearms License) when it was much easier and not so "evil." It was part of a small Sporting Goods business which is another nickle and dime profit margin line. Mostly it was Precision Pneumatic Rifles (high end air guns) but some firearms too. I can't say it didn't allow me to expand my personal firearms collection as well.

It does allow me to make excuses though to have a large amount of radios to my other half without her complaining why I bought another radio. I can claim it is all for the business

Yes, but as most everyone here (with a license) already knows, your radio (be it a UV-5R or something else) is not a "phone".

I can understand how/why somebody that's never seen a small VHF/UHF radio before (that has a DTMF pad) might think it's a phone for a few seconds, but to describe it that way (on purpose) is just wrong (IMHO). Having said that, it's not like the mistake is earth shaking, so most hams just shake it off and consider the source as uninformed.

Would it be possible to listen to these police / fire / ems bands with this radio ?

851.58750

851.61250 851.76250

851.81250

I read that the UV-5R can be programed beyond its factory settings are these beyond its ability's any in put would be helpful thanks.....

My UV5R radios and I have two only cover 130-177 mhz and 384-524 mhz I have confrimed this with a Signal Generator and Spectrum Analyzer.

They can be programed to read anything but the filters will only let you realy use them in this range.

48229. ctcss programming question

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-29 21:28:42 UTC
From: Matt Roman
Topic: 48229 Message: 48229

I am new to the Baofeng and I read the english user manual for the Baofeng uv-5r and have a brief question. I programmed the ctcs transmit and receive to 88.5 hz on channel zero. When I go off channel zero it sets the receive ctcs back to "off". Also, when I go off channel zero by using the A/B button it puts a non flashing "ct" to the left in the "A" line. I programmed this via the radio, should it be done via computer so it might not turn off the receive ctcs? Any ideas on how to keep the receive ctcs set to 88.5? Could it be the squelch setting via computer program?? Thanks for the help.

Like a PRO-106/197/651/652 or a GRE 500/600 or a Whistler WS-1040/1065.
A PRO-96 works with limitations, and a PSR-800 needs a computer to program it. ==
Have scanners, do listen.

```
There hasn't been a UV-5R (or variant) made that doesn't support going up
to 520 MHz in the UHF band.
```

The official range is 136-174 MHz VHF and 400-520 MHz UHF. My testing, though not as sophisticated, agrees with what Gordon has measured.

48240. GT-3 mark III COS

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-30 00:54:43 UTC
From: ve5ps@...
Topic: 48240 Message: 48240

Hello I have seen its easy to pull COS from other baufeng radios but does anyone know if the GT-3 mark III is just as easy? Ive heard the boards inside the two radios are very similar.
It's for an IRLP project.
Thanks

48242. Dul Watch Monitor Priority

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-30 03:57:55 UTC
From: cprendon@...
Topic: 48242 Message: 48242

I am trying to find a way to set up Dual Watch so that when monitoring 2 channels, I can give one prioirty over another. That is to say, (as an example) while there is traffic on display B , if there is new traffic on display A it will break off B and go to A the way scanners do. (please no preaching about how this is not a scanner. I know) It will only go to A when B breaks as long as A is still busy. Anyone know of a way to prioritize one channel over the other in monitoring as described? I don't find anything. Menu 34 doesn't seem to have any effect in this.

From: kf7dur@...
Topic: 48123 Message: 48243

Try turning the volume all the way up.
I have 2 UV5R's and never had a problem programming them using CHIRP.
A buddy recently bought 2 UV5R's and I couldn't read either of them using the same setup that always worked with my radios. After turning the volume to max on his radios I was able to read and write with no problems.
It's worth a try...

48244. UV-5R Power Leak - Battery issue

Yahoo group: baofeng_uv5r (2015)
Date: 2015-01-30 09:13:06 UTC
From: mbuk2015@...
Topic: 48244 Message: 48244

Hi All,

I've had my UV-5R for a few weeks and just noticed that the battery appears to go flat even when the radio is switched off.

ie I charge it full and, even through the radio is switched off, when I come to use it 48 hours later it won't even switch on.

If I use the radio straight after charging it seems fine and the battery lasts 14 hours+ whilst in continuous use.

Is this normal or have I got a dodgy set that is drawing power when switched off? I have another battery which I will be trying and will also try charging the battery and leaving it off the set for 48 hours to see if it loses power over time.

Would appreciate your thoughts

Mike - UK

This is not normal. I have some many radios laying around that it is not uncommon to have one untouched for a week or more. When I finally do grab one of these radios and turn it ON, the battery will be fine.

Subject: Re: [baofeng_uv5r] Baofeng's Huge Announcement

Xaun, the colloquialism used and the sentence structure is almost the same as the Chinese students I taught while living in Beijing for 5-years.

Certain phrases fit the same pattern which makes me wonder, they could have had help from a Chinese Web Master. However, I DO know how some of the Chinese businesses operate and typically to capture a market share from competitors they would disguise themselves as non-Chinese entities. This was very common for clothing manu’s which often took British names and looks for their fashion line.

This justified higher prices because the items were falsely claimed to be made abroad. I would guess the same thing goes for radio dealers too.

The first thing Chinese do while shopping is to look to see if something is made in China (for big ticket items) if so, they will not buy it.

It was interesting to see that the Chinese would take almost out every single appliance from the box and test it on the spot before buying.

Date: 2015-01-30 15:15:15 UTC
From: wassim
Topic: 48251 Message: 48251

Hello All,

Has anyone does a side by side comparison of the two software packages listing features (besides price)?

Can CHIRP do something that RT can't? Can RT do something CHIRP can't? Can CHIRP work with RT cables?

Thanks for any insight.

It's like using visicalc vs. Excel. RTS is so much more polished, but it's radio specific. Their cable is very good as well.

Topic: 48244 Message: 48253

It's not necessarily a bad battery.
If you look on the UV-5R schematic (which yo can find in the Yahoo Group files section) you see a nets labeled BAT and BAT1.
BAT is before the power switch (S1). Some circuits are connected to the battery at all times but normally they don't draw current when the radio is turned off.

There is no offset required for listening. Just put the the RX frequency. TX should be inhibited so that the channel is receive only.

If you are programming a channel that you are going to transmit on, you should already know the transmit frequency (it should be printed on the license or found on the FCC databaset) and not rely on some other app to choose it for you. The license holder should be able to put you in touch with someone that can help you with the correct frequency.

From: n7kuw@...
Topic: 22986 Message: 48266

Commercial and public safety VHF in the U.S. do not have a standard offset. The licensee coordinates two frequencies, one for repeater input and one for repeater output. They could be as close as 600KHz, but they could easily be several MHz apart.

The only way to determine a repeater offset for this is to contact the licensee and get the information from them. Of course, you should always do that before programming any transmit frequency into a radio.

You can search the FCC database for their license if you have enough information to find it (for example, all licenses for the City of X). But again, without their specific permission (preferably in writing) you should never program a transmit frequency outside the ham bands.

well,

RT Systems supports the radio rather well, even between firmware revisions (it seems). Chirp, on the other hand, works best with the pre-A models. SOme of the later models are partially supported (or as one poster in their email group discovered, it might barf a message like "radio does not support current image"). Chirp is also open source, which means that anyone can contribute code to it.

What RT Systems can do:
*. accessible with the NVDA screen reader for the blind
*. sees all menu items and radio settings

What chirp can do:
* supports more models of radio, but can break between radio firmware revisions
* runs on windows and OS X
* partially accessible with ORCA screen reader on Ubuntu Linux

THere are some hitches to each package: RT SYstems doesn't work with jaws screen reader (development issues with how jaws intercepts the screen), Supports only windows.
Chirp: Interface is coded in python, which means additional software may have to be installed for it to work correctly.

On the whole, if you want reliability and easy access to your supported radio, RT Systems is better. If you go with Chirp, you may spend nothing for the program (its donation ware), but you will spend money for the cable and drivers (which may not function properly depending on which manufacturer of cable you purchase).

I personally won't use chirp because the developer has not seen fit to include the blind hams in its use)or development).

Thanks Eric

I do have RT System software for all my radios and I will keep that. I had a feeling, that Chirp had some options that RT did not have.

Now I know I was wrong. I'll stick with RT since I bought all the software for all my radios, including the BF-8HP which RT has a version different from that of the UV-5R. I have two of each of these models.

Chirp can adjust Squelch settings - whereas RTSystems cannot.

Chirp supported the high power radios before RT systems did. Chirp is run by people for a passion all for ham - they do it to help others on a volunteer basis - it is doubtful that the donations even go to the actual developers of Chirp.

RT systems charges more for their software - than you can get a radio for.

A FTDI cable and Chirp are the way to go.

Hi,
It's doable in the software only, not on the radio itself. One has to wonder for what purpose it is available on the software.... If you tag channels to be skipped, you could very well create files with only the channels to be scanned and forget this useless option...
When we need to avoid a channel, it's when we use the radio "live", not tied to the computer waiting to be reconfigured (!!)

... anyway... for the price we pay, I imagine we can't complain...

I've used three different software programs (VIP, Chirp and RT Systems) and for "final version" polished software, RT Systems has them all beat, but yes there is a cost, which for some folks is like asking for a blood donation.

The "real" difference is price is normally far less than the $5 for a cable/free software vs. $49.00 for RT Systems. A "real" FTDI cable usually runs around $20 to $25, which means the delta is closer to $25.

It all gets down to what you are comfortable with. If your entire experience with computers is clicking the "Install" button on MS Office, you should spend the extra bucks and get RT Systems. If you understand drivers (and how to install/de-install them), you can use either VIP or Chirp.

BTW, RT Systems supported various 222 MHz models of radios months before Chirp did, as the Chirp development team was waiting for donated radios to arrive. Having a steady revenue stream allows RT Systems to actually purchase a radio when they need it.

well,
do what works best for you. It just depends on what you want to put up with. before making any final decision, take a look at the chirp-users mailing list and see the number of support issues on there. they also have a website that shows what radios they do support. be aware, if you want them to support your radio, you might have to send them one to experiment with. For some of us (like me living on disability), $50 represents a non-trivial amount of money and it often comes down to what works for me (and chirp doesn't). so, you can send them a radio (and hope you get it back in working condition) or you can spend $50 and KNOW that your radio is supported.

Thanks Craig

Unfortunately my experience with computers is mostly as a software engineer for major financial institutions. Installing MS-Office is not a cake walk by any stretch of the meaning.

I already have invested in RT Systems, for all my Yaesu and Baofeng radios, so I already have spent multiples of that $49.99. But the reason for that is reliability, and support.

I am not saying Chirp is not reliable, or well supported, I am saying that for $49.99 I can get great support that is responsive.

BTW I am a huge fan of blood donations. Any ableed person should give at least once a year on their birthday, for example. If that is done I, and countless others, won't need to do it so often, every 12 weeks. I have a very desirable blood type, O-, CMV- so I am called upon for newborns to end of life donations. Just make it a plan that you do on your birthdays, like a tribute to you.

Thanks

Wassim,

So I have used Chirp, RT systems, and VIP (baofeng only), and the Wouxun software.

So here's the problem I have. I have 3 different brands of radios, Yaesu, Baofeng, and Wouxun. I am adding another brand of CCJ radio this week to use only on a Nano-Node, so I don't know if I'm going to do much "programming" of that radio. In order to get all of my channels (1-127) to be the same for all of them, I SHOULD use RT systems. BUT I don't, and here is why.

I was using the VIP for the Baofengs, the Wouxun software for the Wouxuns, and the RT for the Yaesu. I did like the RT for the Yaesu, but for some strange reason I could never get the "menu settings" to change each time I changed them. No matter what I did it seemed like that RT systems would do the channels properly, but when changing some of the CW and DSP settings, it would only work like 50% of the time. I learned to live with that for a while, because I enjoyed the nice polished look of the RT systems and the menu prompts etc etc etc. BUT It was becoming a big old pain in the keester to tweak channels between the radios. I looked at DLing the various programs from RT, but they claim that you MUST have their cable for the program to work. NOT AN OPTION... That would be an additional $125 just to synch the channels. NOT a justifiable expense.

Then I discovered the Church of Chirp. They saved my soul. They even have instructions for BUILDING your own programming cables. The only radio which is not supported is my KG-950p, but that radio doesn't hardly change. Chirp supports the BF-F8HP, UV-5R, UV-5RTP, FT-857, and the KG-UV8D with SEEMLESS integration of synching the channels. BUT, there is only caveat. You MUST have an image uploaded for your specific firmware of Baofeng, or it won't write it back into the radio. This is a safety feature to keep you from "bricking" the radio and then having to download a factory image etc etc etc...

After using Chirp to program my radios a few times, I have come to enjoy the interface, the simple logic of how the channels are programmed, and that it just WORKS whenever I ask it to. I personally don't care if my software has the latest fashion dress on it, I just want it to work. I was so delighted that it did work, that I made a donation to the project.

Chirp also takes up less hard drive space, no fancy serial numbers to type in, no CD to loose (yes it's a NIGHTMARE to try and get the thing installed on a computer without a CD Rom drive). I'm sure RT systems software is great for some people, but it's going to come down to whether you want pretty software or simple software.

Other than that, I've really found no difference between the two packages. They both work.

Weather channels, Local Utility company (receive only), etc etc etc....

If you're feeling nosey, and want to listen sometimes to heavy traffic stations then you may not want those stations to "open up" every time you're scanning to find an active repeater to hop into a lively QSO.

Also, this is only a personal thing, but there's only 4 repeaters that I actually try to jump in on, because they are "rag chew" repeaters and are pretty open LOS from my QTH. The radio scans SOOOOOOOOOO slow that I don't like waiting on it to scan the other 100 channels before it comes back to the four I like to chat on.

Also, if you're into the WinSystem, then you DEFINATELY want that thing on skip, or that's all you'll hear all day long.

I don't think that scan skip is useless. I kinda like it.

On commercial and public safety (Part 90) frequencies there are NO standard offset. Each business or agency gets a license for multiple individual frequencies then they use one as their repeater input and one as the repeater output. Some agencies that have multiple repeaters are fairly consistent about using the same spacing on each of their repeaters, while other agencies appear to be completely random. Some frequency lists include both the input and output frequencies, but most list only the output frequency because that is what you would listen to.

There is no reason why you (or anyone) would ever need to find a list with the offset or input frequency because the only reason to have that is so you could transmit through the business or agency's repeater -- which requires being authorized by the licensee holder. If the license holder wants to let you transmit through their repeater THEY will tell you the input frequency and tone.

When you program the radio using any of the available software, you can set any channel to be Skipped. You cannot do this from the keypad. And you cannot turn skip on and off except by reprogramming that channel

Hi,
Thanks for clarification and some examples.
I've done just that, e.g. utilities and hi-chatter freqs programmed-in but not tagged as to be scanned, and I keep them visible on the B display of the radio.

From: kf4mdv@...
Topic: 48287 Message: 48287

I'm trying to connect a UV-5R to a TNC-Pi to do APRS. I thought I could just do standard 3.5mm/2.5mm stereo plugs, but of course the shape of the UV-5R precludes that. Is it possible to get the "right" connector somewhere? The connectors I have can't be trimmed enough to fit, and I'd rather not cut on the case of the UV-5R. I've thought about cutting into a speaker mic, but not sure how well that would work.

I built a programming cable using plugs purchased from eBay. They worked fine in my UV-5R.

And those are able to go all the way in? The connectors on my radio seem *very* close to the back of the connector surround. I had to trim the programming cable I bought, because it was designed for kenwood.

Yes. All the way. The plastic shells are 8-sided and must be rotated
so that one side is parallel to the back (closest) side of the socket
well.

I have seen FTDI kits on Amazon for experimenters and they go for 17U$D , I am tempted, I have an older version of the 49$ RS systems but it was meant to use 9 pin D serial cables to connenect to radios and or EEPROM, chips .
As a software engineer I would like to ask how to open the program and read /look at the serial data sent and recieved from the radio. I have a scope that will see it , but how to read it decompile it to a human readable form, I am new to computers , most of my exper is DOS, I am studying Linux now.

MEMORY LANE DETOUR ,,My experience with offsets out side of Hamm . Ie: public service, IS that the repeaters were set up from what ever available frequencies were to be had locally. Such as Two towns with radio systems would join forces and frequencies to Make up a repeater pair. Some times it might be Fire and Police would join up to share a 'Pair" .
I was /still am a Comercial Radio Tech, and did service in those times. This is where those random offsets come from, , Also radios were very narrow in band spread, and 3 Mc was a big jump for them, most were 4 channels , crystal controlled "rock bound" so being able to trade/swap crystals was a financial consideration.

BTW I am 68 yrs old and have been licscensed since I was 17 yrs old. I started out in TV broadcast, did not all ways work in radio.

I had the same problem.

2 things: 1)Make sure you are using the proper USB Driver for your cable, and 2) Make sure your COM Port is configured correctly.

On mine, I find if you press the PTT button on the device, when you start a download or upload, then it will do it. Lastly, make sure the cable is pushed all the way in the radio. Some cables don't plug all thevway in.

I was told there was a fit problem with some of the plastic parts, recently, and that the radio needed to be on a quiet frequency, Not the FM reciever mode, Check to see if plugs are going in all the "way" on the programming cable.

So I got the uv5r with the bvb297 firmware. I was messing around and found, while holding down the ptt, the call button becomes your cw keyer. I looked in the enhanced user guide and found nothing about this. Did I find a cool new feature? Good if your Mic goes out or something. I have two radios, and it even comes in really well on the receiving radio.

Strange, we've had several women ask for Purple and one guy(?) ask for Perrywinkle (sp?), which I guess is some offshoot of Purple. Assuming you didn't have to fork over boatloads of cash for the Boonton meter (that you were making on those $35 UV-5R's), it sounded like an ok event for you.

BFB297 firmware began shipping in late 2012. Unless you have an older radio, it is a safe bet that you do not have BFB297 firmware. Pressing the [3] key while turning on the radio no longer gives you the firmware version because all UV-5R radios (and variants) with firmware newer then BFB297, report BFB297 with this power-on test. To get the "real" firmware version require that you download from the radio using CHIRP and look on the Settings -> Other Setting menu panel.

Apparently Baofeng has moved the 1750 Hz tone burst again. What you describe is consistent with the UV-82 where if the [M] button (equivalent to the UV-5R [CALL] button) is pressed while the [PTT] button is also pressed, a 1750 Hz tone burst is transmitted. Traditionally this has been done by pressing the [BAND] button. Radios without the [BAND] button have used the [A/B] button. And on more recent radios the [BAND] button sends a 1750 Hz tone burst and the [A/B] button sends a 2100 Hz tone burst.

Interesting. Mine is firmware BFS297 and all I get from the Call Button is a light click sent.

---In baofeng_uv5r@yahoogroups.com, <georgeelven@...> wrote :

So I got the uv5r with the bvb297 firmware. I was messing around and found, while holding down the ptt, the call button becomes your cw keyer. I looked in the enhanced user guide and found nothing about this. Did I find a cool new feature? Good if your Mic goes out or something. I have two radios, and it even comes in really well on the receiving radio.

As I stated earlier, all firmware versions since BFB297 (which came out late 2012) all report BFB297 in the [3] key + Power-on message. The exception to that is BFS313 which reports BFS297. So you have BFS313 firmware. George most likely has one of the newer N5R firmware versions.

my question is that when I am scanning the radio stops frequently on several channels where there is only static and then continues to scan. Is there a setting to reduce the static. Also I've noticed when i do lock in on a channnel with radio traffic sometimes there is a lot of static and the radio is not clear....Could these be setting issues or strictly antenna and out of range issues....any advice is appreciated.

Thanks all for the answeres.

Yes, it is a real Power-switch for the GT-3 model. In the meantime I got a new radio and this one works fine. But I can hear that there is something not fixed inside the radio and the antanna connctor is also not fixed very well.

No luck with this radio ;)

Fraid not; you've discovered the 1750c/s toneburst for repeater access.

Mine doesn't do it with the call button, but the A/B and Band buttons
do. (one BFB 293, one BFB 297).

I have both the tone burst, those are on the vfo/mr button and the a/b button. What I speak of, is in the call button. And does not have a high pitch tone or lower pitch tones like both the tone burst buttons. This is a third sound, and sounds nice and smooth, too me it sound just like cw sounds. It sounds like cw on the receiving end also.

I got it from Chirp Profile >Settings>Other Settings>Firmware Message 2. I believe at the time I got my radios about 6 months ago, the Miklor site stated to read Message 2 but now I see it says to take the higher number which is the BFS313 in Message 1 . Either that or I didn't read it well back then.

Do you know of a firmware list of feature changes etc as related to each Baofeng firmware version? I know they keep the changes pretty secret. I have read lots of comments about specific bugs in certain versions, (beep bug, etc) but nothing comprehensive that I have found

--In baofeng_uv5r@yahoogroups.com, <rock.unroe@...> wrote :

Hello

I'm a n00b with a few questions. I HAVE used the search engine, but didn't have much success. So here we go:

I'll be traveling in the US and Canada on my motorcycle. My buddy and I have our HAM tickets and 2 UV-5Rs connected to a headset in each helmet. I'd like to avoid bumping into repeaters and other radio traffic. We'll only be using the radios for this purpose, with a range of 2 miles maximum.

#1. What frequencies do you recommend for simplex bike-to-bike comms?

#2. If any of you ride, can you recommend a good, inexpensive permanent mount, non ground plane antenna? (Are "good" and "inexpensive" mutually exclusive?)

#3. I've seen reference to the UV-5R being set up with "narrow" and "wide" frequency (or modulation) (or something similar I cannot recall at the moment.) Some frequencies should be set as "narrow" and others "wide." What do those words mean in Baofeng-world and how does one set frequencies as narrow or wide? (Or does my question simply reveal my ignorance? If so, edumucate me, please.)

#4. Any advice for using the radio in Canada?

Many thanks to you all.

Horsmann

Well. as far as repeaters you willvhave to look at your route and a repeaterbook and just see where repeaters are and check their. frequency's. for semi private you can look in the manual under CTCSS/DCS tones. make sure you use the same tones on both radios for TX and RX. repeaters will not be much of a problem with you being on simplex.

Using tones just mean you can't hear them, but they can hear you. BTW, ham freqs should be wide, by law, business and public safety must be narrow band.

I guess Google and Bing were both down that day.

> #1. What frequencies do you recommend for simplex bike-to-bike comms?
https://www.google.com/search?q=2m+simplex+channels&ie=utf-8&oe=utf-8
or
http://www.bing.com/search?q=2m+simplex+frequencies&qs=AS&pq=2m+simplex+&sc=8-11&sp=1&cvid=2185b68b215741cfadf4494a60031476&FORM=QBLH

Basically anything from 146.4000 - 146.5950 MHz are considered simplex frequencies; the normal spacing is 30 KHz (or 15 KHz in areas where simplex is crowded).
That makes the common simplex frequencies
146.4000
146.4300
146.4600
146.4900
146.5200 *
146.5500
146.5800

* 146.5200 MHz is the recognized 2M FM Simplex Calling Frequency, so if you don't want to chat with anyone you might randomly bump into and do want to keep chatting with your friend on a single frequency, avoid 146.5200, and probably 146.4900 and 146.5500 as well. The common practice on 2M FM Simplex is to make contact on 52, then move to either 55 or 49. If you hang out on 43 you will probably never hear anyone else your whole trip.

> #2. If any of you ride, can you recommend a good, inexpensive permanent
> mount, non ground plane antenna? (Are "good" and "inexpensive" mutually
> exclusive?)

As you suspect "good" and "inexpensive" are not entirely compatible -- although a lot depends on what you consider "expensive."
One thing to keep in mind is that a simple 19" whip will function entirely adequately as a dual band antenna. While this simple quarter-wave whip on 2M (and 3/4-wave whip on 70cm) does need a ground plane for best performance, if you mount it to any sort of metal on your bike (such as any metal railing) that will provide an entirely adequate ground plane.

> #3. I've seen reference to the UV-5R being set up with "narrow" and
> "wide" frequency (or modulation) (or something similar I cannot recall
> at the moment.) Some frequencies should be set as "narrow" and others

> "wide." What do those words mean in Baofeng-world and how does one set
> frequencies as narrow or wide? (Or does my question simply reveal my
> ignorance? If so, edumucate me, please.)

Nearly all ham FM operation is conducted on what is now considered "wide" bandwidth, even in areas that have adopted 15 KHz spacing on 2M.

"Narrow" bandwidth is required on Part 90 (business and public safety) frequencies.

There is nothing in the amateur regulations (currently) that would require you to choose either Wide or Narrow -- but any repeater you find to use will almost certainly be expecting a Wide bandwidth signal. I don't want to go into a description of how FM works (which would bore some people and confuse others). Let me just say that bandwidth and audio volume are directly related.

If two stations are both using the same bandwidth setting, everything is normal. If one station is using Wide and the other is using Narrow; the wide station will hear the narrow station as if the operator were speaking very softly; and the narrow station will hear the wide station as loud and somewhat distorted.

Since you and your friend are interested primarily in talking just to each other, it wouldn't make any difference; but since you will be operating on ham radio frequencies, you should probably choose Wide bandwidth for easiest compatibility with other operators.

> #4. Any advice for using the radio in Canada?

Be absolutely sure to have your ham license with you at all times.

In the US there are certain freqs assigned to simples use. I have never found them terribly busy and if you combine them with PL codes as previously mentioned, you will likely have little problem. And you will be legal. Here is a page that lists them in pretty simple form.

What do you all do with your old chirp "daily builds" as new ones become available? I have 20140913, 0921, 1202 and now 20150202 on my desktop. I separate my individual radios into folders uv5rv2+, and bf-f8hp and uv5r. I run two laptops, a linux mint 17 and a Ubuntu but I don't recall the version right off as it is at home.

Thanks to everyone for the information provided by this group. I have learned a lot since September.

I'm not sure how you are doing that.

Whenever a new daily build is released, I download the .exe (for Windows), double-click it and then it installs replacing the previously installed version.

I have the CHIRP daily build repository setup on my Linux Mint 17.1 computer and it updates replacing the old version, too.

From: Ray Dunham
Topic: 48341 Message: 48341

Has anyone tried to speed up scan speed by changing the processor crystal to a faster one? This would be used for
receive only. Looking at the schematic, it appears that crystal is not used for the receive/transmit frequency standard. I am not sure if it would work like the early scanners that could be made to scan faster by clocking the processor faster. Any ideas out there? I would like to use it as a cheap scanner rather than ride my bike around with my Yaesu VR-500 hanging
out of my pocket.

No, there is little evidence that the scan speed has anything to do with processor speed of the microcontroller. It is far more likely to be limited by how fast the radio chip can tune a frequency and determine the signal strength on the channel. This is because every radio that uses the RDA1846 chip appears to have the same abysmal scan speed.

Ride safe and have fun. Been motorcycle mobile for about 20 years now. Put a PTT button on your handlebar, you do not want to be fumbling around trying to key the radio. Don't use VOX (voice activated transmit). For the range you are anticipating, you might want to just mount the radio itself above the handlebar with the rubber duck sticking up (as opposed to a permanent mount antenna). RAM has a fantastic range of mounting products and options.

If you have a larger bike, you might also look at Kennedy Technologies devices. www.cellset.com http://www.cellset.com . Let's you integrate the radio audio into your existing bike audio. Works great on Goldwings, larger Harleys, maybe some BMWs (not sure).

I may be doing something wrong. I go to danplanet.com, and download the daily build for linux mint. it gives me the option to extract, which I do to a folder I make on the desktop labeled as to the build date. I haven't seen a way to update, but I may be looking in the wrong place.
Now on the ubuntu machine going through the terminal and doing the sudo commands from danplanet.com, that updates and I'm good there. But on the mint 17, I should just delete the folders for the older versions. At least that is how I read all of this.
One thing thing I am also concerned about though: if I have a factory image that I downloaded from a new radio with an older version of chirp, Johns response says "In some cases, using an older version can create its own issues.The Latest Daily Build has warnings to prevent cross loading old images to new radios, which can create its own problems."
SO if i have an image from an older build, I can't use that to take my radio back to the factory version? I do keep separate files for each radio (I will soon be up to 4), due to each one having different firmware versions. I have been able to import and export repeater settings, so I may be reading this wrong.
I appreciate all John and Jim, you guys are great and I have learned a lot. Thank you for all your assistance.

"If you want to operate on UHF 446.000 is the only simplex frequency."

+++

While it's true that all of North America uses 446.000 MHz as the National Simplex Frequency (also referred to as the calling frequency), in most places, the channels immediately adjacent to 446.000 MHz are used as simplex frequencies as well, spaced by 25 kHz. This means that 445.925, 445.950, 445.975, 446.025, 446.050, 446.075 MHz, etc. are all valid simplex frequencies. But beware, as some local areas have assigned these frequencies to repeater operation.

While the ARRL band plan sets the guidelines for band use across the US, VHF and UHF band plans are really defined on a *statewide or regional* basis. This means it's best to find the specific band plan for your area. This may be a challenge to find the right information, but try searching the web for “70 cm band plan” in your state. A good source is your local frequency coordination body, which can be found on the ARRL web site, or check out http://nfcc.us/ for more info.

In any case, 446.000 is most certainly NOT the only simplex frequency available for UHF use (although it is the most common frequency used, just like 146.52 on 2m), as the UHF 70cm band is 30MHz wide (compared to 4 MHz on 2m).

Go to the CHIRP download page and perform the 3 command listed for
Ubuntu that are under the Daily Developmental Builds column. This will
install the latest daily build in the repository and update it just
like any other OS updates.

Then if you haven't already, go here...

http://chirp.danplanet.com/projects/chirp/wiki/Running_Under_Linux

and perform the command listed under "serial port permissions" to add
your user into the "dialout" group.

Tracy,

Please check your data before by posting inaccurate information. 164.4000 _through_ 146.5950 is considered the SEGMENT of the 2M band where FM simplex is the commonly expected mode. It is a range, not two specific frequencies!

This is simply the space that fits neatly between the normal repeater inputs and normal repeater outputs. While ham bands are not officially channelized (except 60M), traditionally 2M FM frequencies were channelized at a 30 KHz spacing, which made the normal 2M simplex 'channels' 146.40, .43, .46, .49, .52, .55, and .58

More recently, as repeater 'channels' in the larger metropolitan areas began to fill up, "splinter" frequencies on a 15 KHz spacing came to be used (a very few areas tried a 20 KHz spacing). Simplex channels have followed the same pattern, thus adding 146.415, .445, .475, .505, .535, .565, and .595 as acceptable simplex frequencies but these are rarely used.

Subject: [baofeng_uv5r] Re: new. Canada. Motorcycle. Best frequencies?

Here in the states 146.400-146.580 are the 2 meter simplex frequency's with 146.520 being the call frequency. If you want to operate on UHF 446.000 is the only simplex frequency.

If you say so, I can only say that my radios were new in the shrinkwrapped box, and had nothing whatever wrong with them that I can see, programmed fine and work well on both VHF and UHF. Um, discover what? I’ve nothing to complain to the vendor about, Perhaps the market to Americans is different, I can only say I buy a LOT of stuff direct from China and have not had any issues with any of it. Perhaps I’ve been lucky, but there is no real ‘Amazon’ equivalent here anyway and there are no ‘vendors’ selling them at every street corner as seems to be the case in the USA. Ebay is your friend for things like this in Oz. What I would like to know is if there is a parts source, one of them has had one of the numeric pushbuttons and the orange side button torn off – the switches beneath them are fine and can be operated, but the rubber buttons are gone. Can these be obtained anywhere as a spare part? From BaoFeng in China perhaps?

While that may be true of some sellers on ebay, it certainly isn't fair to characterize all ebay sellers that way. I have purchased a couple harder to find (in US) Baofeng radios from ebay sellers with 99%+ ratings and had no problems.

I found my Chinese supplier on Allibaba. That supplier also sells on eBay. I ordered 10 Baofeng UV-5R+ radios on Friday and they were sitting on my door step the following Thursday. I'm working on a new purchase for the Baofeng UV-5RTP 1,4, 8 watt radios.

So far I'm very pleased with the service and quality of my Baofeng purchase. My supplier stays in touch and has earned my trust.

Naturally 446.000 is not the only simplex frequency as any frequency can be used in simplex operation. I stated it was the only simplex freq due to the chance that they may run into interference with a coordinated repeater if they use anything else. I live in a very rural area and even here everything above 446.000 will cause interference to a repeater. That may not be the case everywhere but why risk it when there are plenty of other frequency's available.

I know this thread is about what frequencies to use for simplex in Canada. But, I haven't seen anything about operating procedure there. So, at the risk of getting a little off subject. Here goes.

The following is a quote from the section explaining the special requirement for IDing while in Canada:
"There is no need for paperwork or other formalities when exchanging visits between Canada and the United States. Under the terms of the agreement, the visitor must identify using his or her call sign followed by a call area suffix, e.g. VE3FRV/W9 or N9CFX/VE3."

Here is a pointer to a copy of the reciprocal operating agreement:

https://www.rac.ca/en/amateur-radio/regulatory/operating-in-canada/canada-usa.php

There is a lot of good information there including band plans.

Enjoy, Fred, W3MUD

Tracy,

Repeaterbook shows a total of 62 70cm repeaters within 50 miles of your location, and *NONE* of them have a repeater input anywhere near 446.000 (plus or minus a few 25 KHz simplex band steps).

I think anyone traveling through your area wouldn't have much of a chance of tripping up any repeater using any of the standard 70cm simplex frequencies, although I agree that 446.000 is still the best choice for most folks using UHF simplex.

If you...
1. only have this one computer
2. don't expect to ever program another Baofeng radio
3. don't expect to get a CHIRP Radio Image file from someone else
5. still have the CHIRP program that you used 2 years ago installed on your computer
6. still have the CHIRP Radio Image file that you saved from your computer 2 years ago

Then, no, you don't have to use a current CHIRP.

If any one of these statements is not true, then do yourself a favor and install the latest CHIRP daily build. There there have been some 58 patches submitted in the last 2 years to fix bugs and add enhancements for the Baofeng UV-5R type radios. Once you've downloaded the current daily build, it only takes a minute or 2 to update.

I finally got around to taking my UV-5R V2+ apart. I hoped to find a board with a good silkscreen on it, labeling each of the parts. Ooooh noooo... Not even close. As far as I can tell there's no silkscreen layer on the board at all. Just components.

I uploaded a picture of it to the photos area, and a full sized version to the files area:

https://groups.yahoo.com/neo/groups/baofeng_uv5r/photos/photostream/lightbox/1046280848?orderBy=mtime&sortOrder=desc&photoFilter=ALL#zax/1046280848 https://groups.yahoo.com/neo/groups/baofeng_uv5r/photos/photostream/lightbox/1046280848?orderBy=mtime&sortOrder=desc&photoFilter=ALL#zax/1046280848

https://groups.yahoo.com/neo/groups/baofeng_uv5r/files/UV-5R%20V2%2B%20Vreg%20Investigation/ https://groups.yahoo.com/neo/groups/baofeng_uv5r/files/UV-5R%20V2%2B%20Vreg%20Investigation/

Since the vreg may be damaged I can't exactly probe around on the board to see where the 3.3V source is coming from. I can go through and ring out the 3.3V line from the processor and try to trace it back to the regulator, but if anyone can point to the 3.3V regulator in the photo I uploaded, that would save a ton of work.

If I make any headway on this at all, I'll post new photos with whatever I find and whatever replacement I can come up with. Feel free to add photos or files to the album/directory I created if you have any info you can add.

It seems like this isn't a completely common issue with these radios, but I've seen a couple of other instances here and on other sites on the web. The common thread seems to be that the battery was completely depleted, the radio was dropped into its charger, and it came out with what looks like a bad display, but is, in fact, a dead radio. I hope Baofeng can figure out what's causing this (bad Vreg? ESD sensitive parts on the input? etc?) and fix it in future revs. But for now if I can get my radio working and help someone resurrect theirs, I'll be happy.

Tom

If you say so, I can only say that my radios were new in the shrinkwrapped box, and had nothing whatever wrong with them that I can see, programmed fine and work well on both VHF and UHF. Um, discover what? I’ve nothing to complain to the vendor about, Perhaps the market to Americans is different, I can only say I buy a LOT of stuff direct from China and have not had any issues with any of it. Perhaps I’ve been lucky, but there is no real ‘Amazon’ equivalent here anyway and there are no ‘vendors’ selling them at every street corner as seems to be the case in the USA. Ebay is your friend for things like this in Oz. What I would like to know is if there is a parts source, one of them has had one of the numeric pushbuttons and the orange side button torn off – the switches beneath them are fine and can be operated, but the rubber buttons are gone. Can these be obtained anywhere as a spare part? From BaoFeng in China perhaps?

Xuan you need to re-read what I wrote CORRECTLY. Nowhere in my post did I say he can only use 146.400 and 146.580. I said simplex is 146.400-146.580... The dash sign between 146.400 and 146.580 means through, not and. In other words 146.400 through 146.580. I would have though you would have learned that in your early school grades but apparently not. Therefore I did not post inaccurate information, although due to your typo reading YOU DID post inaccurate information saying he can use 164.400_through_146.595... I conclude that in some areas you can still talk as high as 146.595 but in my area you cannot due to possible repeater interference. I have been a licensed amateur operator for nearly 15 yrs. I realize I do not know everything, but I do know the band limits.

In my short few weeks of being a member here I'd already noticed a few computer loud mouths here that love to split hairs and twist the words of things posted. I only post to help people, not to try to make myself look smarter than the next guy. I do not need this hate and aggravation so Xuan I'm leaving it up to your infinite wisdom to keep things in order because I'm bowing out..

There IS a problem with the latest version of the Mac operating system. Many people have this problem with the computer not working with Chirp after the up-grade.

DO NOT UP_GRADE to the latest Mac OS. There are several other problems as well as working with Chirp (computer runs a lot slower also !)

If you can - go back the earlier OS.

No one on this forum seems to know what the answer is and Apple are no help either.

Actually, and this is just me.... I'd go a little higher. 147.42-147.57....

Somewhere in that neighborhood. Nobody really uses that segment, so it's pretty quiet.

When it comes down to it, LEGALLY you can transmit anywhere in the assigned bands as outlined by the FCC. So VHF opens up to 144.100-148.000 and UHF opens up to 420.000-450.000. As long as you don't cause intentional interference or fail to identify every 10 min or at the start, at the end, blah blah blah blah... Yer LEGAL. NOW that being said the ARRL band plan is nothing more than a SUGGESTION so that as long as we follow it everyone can play nice in the sand box.

Using. UHF. on the road????? Nah.... Not for me. VHF..... Heck yah....

There is NO FCC rule that says you must identify at the beginning of your transmission, just every 10 minutes and at the end. There is also NO FCC rule that says you ever have to use the other person's call sign either.

I'm using the latest version of Yosemite and had been using the developer version for some time before official release. Not only has my iMac been running considerably faster, but also Chirp has been running correctly with both Baofengs and Wouxuns. Python and drivers were installed in Mavericks and survived the upgrade with no problems. I have a friend with a similar set up and he has experienced no issues either.
Some sort of corruption occurred during the upgrade; I always repair disk permissions and verify/ repair the HDD before a major upgrade to avoid potential problems. You could try booting from the recovery partition if it was installed (restart holding cmd + R) and reinstall the latest version of the OS (Google for full instructions). If I can come up with any solution I'll post it here.

You must be up for a challenge. That sounds like a lot more work than it might be worth for a $35 (US) radio. Good luck. I have done that kind of thing before with a dual trace scope and it can be quite time consuming to say the least.

---In baofeng_uv5r@yahoogroups.com, <benedict@...> wrote :

I finally got around to taking my UV-5R V2+ apart. I hoped to find a board with a good silkscreen on it, labeling each of the parts. Ooooh noooo... Not even close. As far as I can tell there's no silkscreen layer on the board at all. Just components.

I uploaded a picture of it to the photos area, and a full sized version to the files area:

https://groups.yahoo.com/neo/groups/baofeng_uv5r/photos/photostream/lightbox/1046280848?orderBy=mtime&sortOrder=desc&photoFilter=ALL#zax/1046280848 https://groups.yahoo.com/neo/groups/baofeng_uv5r/photos/photostream/lightbox/1046280848?orderBy=mtime&sortOrder=desc&photoFilter=ALL#zax/1046280848

https://groups.yahoo.com/neo/groups/baofeng_uv5r/files/UV-5R%20V2%2B%20Vreg%20Investigation/ https://groups.yahoo.com/neo/groups/baofeng_uv5r/files/UV-5R%20V2%2B%20Vreg%20Investigation/

Since the vreg may be damaged I can't exactly probe around on the board to see where the 3.3V source is coming from. I can go through and ring out the 3.3V line from the processor and try to trace it back to the regulator, but if anyone can point to the 3.3V regulator in the photo I uploaded, that would save a ton of work.

If I make any headway on this at all, I'll post new photos with whatever I find and whatever replacement I can come up with. Feel free to add photos or files to the album/directory I created if you have any info you can add.

It seems like this isn't a completely common issue with these radios, but I've seen a couple of other instances here and on other sites on the web. The common thread seems to be that the battery was completely depleted, the radio was dropped into its charger, and it came out with what looks like a bad display, but is, in fact, a dead radio. I hope Baofeng can figure out what's causing this (bad Vreg? ESD sensitive parts on the input? etc?) and fix it in future revs. But for now if I can get my radio working and help someone resurrect theirs, I'll be happy.

Tom

Per the schematic located in the Files section of this forum https://xa.yimg.com/df/baofeng_uv5r/SCHEMATIC-baofeng-uv5r.pdf?token=taFngk4eEI3bAsEl0mMnPxJI6dgvqPl_bBuW9EWMRC05AEBi666SPHkabqGoSqocaJaUyXSe8LT7u56d1gClCtv3bReVjMaYEeb6fe-Jay0cEpKFGwODLjlTCKo0IgGcitbp8JAOV6PUUMyb76aLiQ8eZP_K3xhvvnRR8jpYu2LI_vQD4oA&type=download, the 3.3V regulator would appear to be one of the 5-pin parts just below the power/volume switch. The schematic doesn't quite match the component layout of your image though (capacitor in your photo across pins 1 and 3, pin 5 connected instead of only a 3-pin part, etc.).

What might be easier would be to measure the voltage at one of the components which uses the 3.3V. According to the schematic, U2, the RDA1846 chip, uses 3.3V at the VDD pin, pin 1. RDA1846 is clearly visible in the lower left of your image.

Wrong.
97.115 (d) At the end of an exchange of international third party communications, the station must also transmit in the station identification procedure the call sign of the station with which a third party message was exchanged.
Tom

There is also NO FCC rule that says you ever have to use the other person's call sign either.

48379. UV-82L and CHIRP

Yahoo group: baofeng_uv5r (2015)
Date: 2015-02-05 15:25:57 UTC
From: jdhite1@...
Topic: 48379 Message: 48379

Hello All-

Last year I created CHIRP programming files (chirp, csv, img) for a UV-5RA HT. CHIRP worked perfectly with these and my UV-5RA functions exactly as it should. Now I have a similar, but different, HT -- the UV-82L. Can I program this HT using my old file(s) and expect the same success I had before, or do I need to start all over again?

Also, can I continue to use the CHIRP build which is known to have worked perfectly before with the new UV-82L, or must I go to the latest daily build?

Any advice would be appreciated.

Only one minor observation to James' post. 420-430 is only permitted below Line A. North of Line A, and throughout Canada, you cannot operate on 420 to 430 MHz.

Also, just a suggestion. For relatively short range, bike to bike communications, I would suggest using a CTCSS or even better a DCS tone on transmit, and pick a "non-standard" tone. This should greatly reduce the chance of accidentally bringing up a repeater. Most repeaters are tone-guarded on receive (required by many coordination bodies). Without the correct tone, you shouldn't bring up the repeater. Using no tone at all would also serve that purpose.

As to channel spacing, some areas use 20 KHz rather than 30 KHz. In Washington State standard channel spacing would be, for example, 146.42, 146.44, 146.46, 146.48, etc. As a result, when traveling, you could find yourself actually interfering with two adjacent "channels" if you are on a different channel spacing than that particular area. Just minor details that are at least worth being aware of.

48383. [baofeng_uv5r] OT: "Legally"

> as outlined by the FCC. So VHF opens up to 144.100-148.000 and UHF opens up to
> 420.000-450.000.

That is ALMOST true, James. Assuming we are talking about one of these little FM radios, and the frequency shown in the display, then transmitting on 144.100 would be in violation of 97.305 and transmitting on 148.000 would be a violation of both 97.301 and 97.305

> As long as you don't cause intentional interference

Actually interference does not have to be intentional to be considered a violation. Because the FCC pretends it still believes licensed amateur radio operators are technically competent, you are fully responsible for the operation of your station. Thus any out-of-band or out-of-segment emissions are violations regardless of intent and even when no actual interference occurs.

Further, even within the authorized bands and segments, interference does not need to be intentional. All that is required is that the operator knew or should have known that interference was likely. Operating simplex on a repeater input frequency is one example of the kind of operation where the FCC assumes you knew or should have known you would be causing interference.

> or fail to identify every 10 min or at the start, at the end, blah blah blah blah... Yer LEGAL.

Jardy already mentioned that there is no legal requirement to identify at the start of a transmission.

> NOW that being said the ARRL band plan is nothing more than a SUGGESTION
> so that as long as we follow it everyone can play nice in the sand box.

Actually it is slightly more than just a suggestion. While band plans do not carry the force of law, the FCC has issued notices charging violation under 97.101 for particularly egregious disregard of the generally accepted band plans. For example, a US station is not likely to be cited for transmitting on 3795 KHz, but if you and your buddy repeatedly fire up your 100W FM phone signals between 435-438 MHz the results might be quite different.

As you say, following the band plan is how we all "play nice in the sandbox" -- and playing nice IS required by 97.101

thanks for this.
Yes. I've read enough to know the PTT is mandatory. I'm researching antennas but won't get one until I've tested what I've got.
Mounting a Baofeng on the handlebars is a possibility (although there's not much handlebar available.) I worry about rain. There are things I've heard about called "plastic bags." Might have to research that, too. (I've spent too many hours riding in the rain. But any riding is better than most other things!)
I'm doing all of this on a Suzuki DL650, so "larger bike" doesn't apply.
Right now I'm leaning toward using 70cm band, programming two or three different frequencies that aren't used for anything else, and just using the darn HTs. (Plan is subject to change without notice.)
Thank you, again.

Hi John-

Thanks for the good advice. Ordinarily I would have used the known good software which worked so well before here, but instead, I will get the latest build.

As for the method, since I'm unfamiliar with the "import/export .csv files" technique, I believe I will do things the first way you suggested (downloading from the radio to create an initial template, etc.).

Thanks again!

John

Subject: [baofeng_uv5r] Re: Error trying to download radio

I'm using the latest version of Yosemite and had been using the developer version for some time before official release. Not only has my iMac been running considerably faster, but also Chirp has been running correctly with both Baofengs and Wouxuns. Python and drivers were installed in Mavericks and survived the upgrade with no problems. I have a friend with a similar set up and he has experienced no issues either.
Some sort of corruption occurred during the upgrade; I always repair disk permissions and verify/ repair the HDD before a major upgrade to avoid potential problems. You could try booting from the recovery partition if it was installed (restart holding cmd + R) and reinstall the latest version of the OS (Google for full instructions). If I can come up with any solution I'll post it here.

Hi all
Im hoping that you might be able to help me with a problem.I have two Baofengs UVB6 & GT3 MK2 the UVB6 was working fine when I first got it I had it connected to a Diamond X30 in my loft and it was working fine then one day the audio on TX went very quite to the point where no one can hear me? So I then got the GT3 MK2 and the same thing full carrier on TX but low or no audio? I then got a friend to help me with a radio to radio test(line of sight) and we could hear each other fine but as soon as I try and transmit from my home set up same problem no audio but full carrier.I know my coax and antenna are fine as I have my ICOM 2350H connected to them and it operates fine everytime.If anyone has any ideas I would be grateful.

Some of these radios do have low transmit audio for one or more of several known reasons, but I don't think your radios fall into any of these categories because you say that the audio was good and then suddenly it was low on both radios at the same time.
Let me ask one thing. Did you happen to program both radios shortly before you noticed the problem??
I suspect that both radios accidentally got set to Narrow bandwidth, which would have the effect of immediately cutting your transmit audio by at least half.

Hi,
Very much a newbie, I have just purchased a Baofeng GT3, and need to expand frequency from factory to 400Mhz - 520 MHz to accommodate AUS UHF frequencies. Apparently this can be done via chirp. could someone please explain to me the full process. Sorry if this has been covered before.
Thanks again

48400. Only two contacts on charger?!

Does anybody have a charger that has only two contacts too?
If you are wondering, where the power switch comes from; I added it to the charger to be able to be able to turn it of, because the red/green LED flashing is very annoying.

I will bet that your GT-3 came from the factory with UHF set to 400-520 MHz. What make you thing it isn't? Have you tried to key a frequency above 480 MHz into the VFO?

I've not heard of this either.

It this were my computer, I would...

- go to device manager and double-click the entry for the programming cable.
- select the "driver" tab
- click the "uninstall" button
- tick the box "delete the software for this device
- press the "ok" button

follow the prompts to uninstall the driver and then reboot

then continue by...

- following the "Installing the Proper New Prolific PL-2303 Drivers 3.2.0.0" guide on miklor.com

Hi John-

I just wanted to let you know that it all went perfectly. After installing the latest build of CHIRP, I downloaded the default information from the UV-82L. The columns headers and general information structure turned out to be identical to the previous files I had worked with for my UV-5RA HTs. So I was able to upload the programming file I had already made, and now all my radios have the same channel configuration -- very nice!

73 and TNX for the accurate (and rapid) advice!

Short Topic Drift re the UV82L.... Any idea why Baofeng decided to design in a rocker-style PTT switch? I see what it does, how it works, etc., but I don't get the benefit. It's certainly easy to accidently xmit on the wrong freq (fat fingers, heavy gloves, etc.)!

John

Thanks Jim,

I did try that but I will try it again tonight. According to MS:

"An INF file is a text file that contains all the information that device installation components used to install a driver. Windows installs drivers using INF files. This information includes the following: Driver name and location."

I have MS update to ask me before installing updates so i can approve them. Is there any good reason to try to delete the other incorrect drivers? I dont know where they are but if i could...

Btw, i get this "Inf" error even if trying to install the incorrect windows drivers.

Thanks for the info, John. I'll have to try this new PTT scheme and see how I like it. So far it seems that the user winds up transmitting momentarly whenever they switch between the top and bottom freq.s (A vs B) when using the PTT rocker switch "dual mode". IOW, a short kerchunk occurs -- not good.

Copy-and-paste works, and it is probably the easiest to explain, but the best way to transfer channels from one radio brand/mode to another radio brand/model is to use the CHIRP import capability.

Copy-and-paste only transfers the compatible columns that you see on the main spreadsheet style memory editor. Import will also copy the compatible extra settings (like BCL and PTT-ID for example) and correctly map to the power levels of the source to the closest power level of the target.

Using a CSV file has the same limitation of copy-and-paste. Using the native CHIRP .img data file also eliminates the step of creating the CSV file.

Here is how it is done...

File -> Import -> {change the file mask to "CHIRP Radio Images (*.img)"} -> locate and then import the desired .img file.

It is really pretty easy and I use it regularly to transfer my "master" channels to my various Baofeng radio models and other Icom, Kenwood, Wouxun and Leixen radios.

Hi,
Maybe you have tone squelch enabled with the wrong tone, so when you hit "monitor" it disables this CTCSS and then you hear the comm.
And when you enter manually the frequency, you are not entering a CTCSS so again, you can hear the trafic on this frequency?

My understanding is, reach radio you get, you need to use the latest build for that model radio. So if you got 3 different radios you may be using 3 different builds. Go to miklor website to get the latest build for that radio.

Not exactly. You only need one version of CHIRP. The latest build that added a feature or fixed a bug for one of your radios. It doesn't hurt to have any version after that, so it is just easier to have you download and use the latest daily build.

Hi Jim-

Thanks for the nice explanation. Luckily, using my existing programming file from my old UV-5RA HTs worked perfectly for the UV-82L as well. So now all the HTs have the same channel setup - handy! Some folks complain about CHIRP, but I have never had a single problem with it (knock on wood <g>).

As far as I can tell, one CHIRP build can be used with many different radios since the program allows one to select the make and model of radio being programmed. In the case of Baofeng, I know for sure that a single build works fine with both UV-5RA and UV-82L HTs.

48430. Ubuntu CHIRP and Baofeng USB cable

Yahoo group: baofeng_uv5r (2015)
Date: 2015-02-08 00:01:01 UTC
From: Frank Ney
Topic: 48430 Message: 48430

With Win8.1 locking out my programming cable I'm now attempting to use my T60 with Ubuntu 12.04

The repository installed CHIRP 0.4.0, and I followed the instruction to open my username for dialup. Problem is, I am still getting this error when I attempt to download the radio

Could not open port /dev/ttyUSB0 Errno 13 Permission Denied

I didn't do anything special with respect to the programming cable except plug it into the USB (only one, not sure if it's 1.1 or 2.0). I'm reasonably sure I have a legal cable, it even has Baofeng stamped on it.

Any advice?

Hi Frank,

My first advice is not to use the CHIRP v0.4.0 with a Baofeng radio.
You need to install the repository for CHIRP snapshots so you can use
the latest daily build.

Second, did you log out and then log back in after you put your user
in the dialout group? It doesn't inherit those new rights until you
do.

Be VERY VERY careful about the restore feature. If you have had or made ANY updates/changes to anything/anywhere on your computer since the restore date/time you choose, you will wipe those out and can even cause serious problems if you did an uninstall since that date as the registry will start looking for things that no longer exist. Make sure you CREATE a restore point for now before going back.

In addition, having the name "Baofeng" on your cable means absolutely nothing as far as it being legitimate or not, as Chinese companies have zero respect for things like copyrights, patents, etc.

Scanning you are listening to memory channels - when you enter frequencies manually you are listening to the frequency via the VFO, using the defaults for the VFO

In your case, you have a Receive CTCSS Tone or Receive DCS Code programmed in the memory channel, which is why you don't hear anything unless you press the monitor button.

There is almost never any reason to have any Receive CTCSS Tone or Receive DCS Code programmed in any channel -- and NEVER ANY REASON for anyone to program these tones/codes without understanding exactly what they do.

Go back to whatever software you used to program the radio with data that you don't understand then remove all Receive CTCSS Tones and all Receive DCS Codes - save the data, then re-upload that data to your radio and try again.

Subject: [baofeng_uv5r] question on scanning

Hi. when i am scanning, some frequencies will no stop and broadcast, they stop, but i hear nothing unless I hit the monitor button. however, if I exit scan mode, and enter the freq in manually, i hear it fine. what am I doing wrong?

Thanks fellas.

Firstly, the repository is probably outdated.. First we need to remove the chirp package, in terminal type... apt-get --purge chirp

Next go to the download area for chirp and follow the instructions for installing the daily development build, as this is most up to date.
http://chirp.danplanet.com/projects/chirp/wiki/Download
http://chirp.danplanet.com/projects/chirp/wiki/Download

Please get back to us and let us know how you get on.

Hi,

The affirmation "There is almost never any reason to have any Receive CTCSS Tone or Receive DCS Code programmed in any channel" may be a reality in your context, but be careful to generalize it as being a general rule ;-)

In *my* context, I use CTCSS to filter out two towing companies channels out of a leased common users repeater where there is lot of other non-interesting trafic for me.
I also use this feature to filter out data transmitted on the same frequency as voice comms on another service I monitor, where only voice comms have PL Tones, so with the right CTCSS enabled I can listen to voice traffic without the data noise.
Other users "context" may be different from our own ;-)

So YMMV !

48439. PTT, Kenwood plugs and GPS/MP3

Yahoo group: baofeng_uv5r (2015)
Date: 2015-02-08 15:44:59 UTC
From: horsmann5@...
Topic: 48439 Message: 48439

I have a PTT switch that I use with a helmet headset on my motorcycle.
I've looked at the Kenwood plug schematic on Miklor and it appears that both plugs are used when activating the PTT function from the headset.
Can someone confirm this?
I ask because I want to connect my GPS and perhaps an MP3 player to the headset while maintaining the ability to use the PTT. (I would do that using something like this: Welcome to Electric-Avenues.com - The AmpliRider http://www.electric-avenues.com/amplirider.html

http://www.electric-avenues.com/amplirider.html

Welcome to Electric-Avenues.com - The AmpliR...
http://www.electric-avenues.com/amplirider.html The AmpliRider is an amplifier designed for motorcycle riders. This amp connects to the 12 volt supply on your motorcycle.

View on www.electric-avenues... http://www.electric-avenues.com/amplirider.html
Preview by Yahoo

I would need to separate the input and output of the Baofeng for the amplirider into two separate cables. If I do that, will my PTT switch still work?
Many thanks for your thoughts.

H

Confirmed. The PTT switch needs to be between the 3.5MM sleeve and the
2.5MM sleeve.

In the amateur radio service, receive tones are rarely used. In the business/commercial/public safety world, they are almost always used (for the very reasons noted by Sylvain). I do know many amateurs who do program receive tones (myself included) to avoid both intermod in very heavily congested rf environments, and in isolated cases where you can hear a distant repeater on the same channel as a popular local repeater.

If you do program a receive tone, it is also "good practice" to program busy channel lockout so that you cannot transmit when there is another signal on the frequency (that you can't hear because you are tone guarded).

This theory works well as long as the repeater you are listening either retransmits the tone or puts out one of it's own. Not all repeaters put out tones.

In my area it is common practice for a repeater to have a transmit tone. This is extremely helpful to avoid issues with external noise and such opening a squelch. Handheld and mobile operation is prone to this, which repeaters are designed for anyway. I'm really surprised when a hear folks say in their areas a repeater does not transmit a pl. What are repeater groups thinking? Especially in urban areas with intermod prone areas. I always program a pl.

Busy channel lockout is IMHO useless on repeaters. It is considered proper etiquette to NOT let the repeater transmitter drop. As long as the reset tone sounds, then you should transmit. Of course, some systems simply drop their transmitters immediately.

All this is based on how things work in everyone's area. Get ten regions and get ten different ways how things are done.

If you are out in the middle of nowhere, you won't have the problems just described. I live in Vancouver, WA, just across the Columbia River from
Portland, OR. It was only a short time ago our main repeater was set to transmit a tone. I am just saying if the receive tone setup does not work, this may be the reason why. In very crowded areas, it would be unusual to not have the repeater transmit a tone, just for those reasons.

(myself included) to avoid both intermod in very heavily congested rf environments, and in isolated cases where you can hear a distant repeater on the same channel as a popular local repeater.

From: horsmann5@...
Topic: 48439 Message: 48448

Thanks, Jim
Can you see any way for me to kludge a solution to this? I would really like to be able to hear the GPS and the Baofeng. The amplirider seems like a simple solution to that problem, except for PTT.
What wiring would accomplish the same thing using separate MIC and SPKR plugs?
Any ideas/suggestions/considerations? To my limited experience, it looks as if I'd have to dig into the guts of the PTT or the connector coming off of it. Yes?

Many thanks.

my little faithful UV5R behaves a bit odd.

Here in the UK the VHF repeaters have a shift of -0.6MHz while the UHF ones have a sgift of +1.6MHz

the UV5R works a treat with VHF repeaters, but does not play ball with the UHF ones, when I select a memory, key TX the display goes blank, then when I release the key it springs back to life. No red TX led either, just a dead radio.

Is this a known issue? Is the repeater offset out of range? Have I got a faulty unit or do I simply need a newer UV5R?

Thank you

How do you program this radio (keypad, Baofeng software, CHIRP software)?

If CHIRP, look on the Settings -> Other Settings menu panel and report
the firmware version (1 & 2)

In the nearly 3 years I have monitored this group, there have been plenty of new users that can't hear a thing on the channel they are listening to but they know there is activity because they see the RX light com on and they can hear it when the [MONI] button is pressed.

Xaun's point was if you don't know how to use CTCSS or why you are using CTCSS, you should start out with TX CTCSS only. Using no receive CTCSS always works. Setting receive CTCSS incorrectly nothing will be heard. Then once there is an understanding how CTCSS works and how to properly implement it, then go ahead and use it on receive too.

This instance was a perfect example. An RX CTCSS tone was programmed where one shouldn't be used and nothing could be heard.

For beginners, no RX CTCSS is the right call.

I use a metal paperclip to verify that the mike hole is not blocked internally. It is a good fit for the hole and as long as you are gentle, you are very unlikely to damage the mic element.

Hi. Have you used a speaker mic on this radio, or inserted another plug into the speaker mic jacks? Some of these radios have shown a problem where the jack doesn't re-establish internal contact after removing the plug. Some have found that carefully cleaning inside the jacks will, at least temporarily, fix the problem.

Also I live in a bowl were we get a lot of frequencies coming through which are the TX freqs of repeaters (on the surrounding mountain ranges) out of our area but in good conditions we can pick them up (with high gain antennas) on the same freqs that our repeaters TX on. All but one repeater in our area pass the RX PL on to the TX side and we use that PL (CTCSS) to block the unwanted traffic from being recieved on our repeater freqs. Without that we are picking up all kinds of unwanted conversations on our repeater (our RX freq) channel freqs that are not from our repeaters. So the answer is to use the CTCSS of the repeater RX freq on OUR RX freq. Common and RECOMMENDED in our area's frequency plans.

At first I was very confused because of what was said here over and over that you never use CTCSS on the radio channel repeater programming your RX side. Then I started researching club's frequency plans here and thought someone was wrong because most tell you to program the same CTCSS on your RX side as you do on your TX side. Being new I asked around and found that what was beign said here was wrong in at least some cases. If you say never then it is always wrong.

It's a simple enough thing in CHIRP. Under Tone Mode you just use TSQL instead of Tone. The same CTCSS is set on both the TX and RX freq per channel. Clean air is the result.

---In baofeng_uv5r@yahoogroups.com, <lamarrsy@...> wrote :

Hi,

The affirmation "There is almost never any reason to have any Receive CTCSS Tone or Receive DCS Code programmed in any channel" may be a reality in your context, but be careful to generalize it as being a general rule ;-)

In *my* context, I use CTCSS to filter out two towing companies channels out of a leased common users repeater where there is lot of other non-interesting trafic for me.
I also use this feature to filter out data transmitted on the same frequency as voice comms on another service I monitor, where only voice comms have PL Tones, so with the right CTCSS enabled I can listen to voice traffic without the data noise.
Other users "context" may be different from our own ;-)

So YMMV !

Emyr,

After thinking about this some more I am wondering.

I doubt this has anything to do with the 1.6 MHz shift. Why don't you program a UHF simplex channel and see what happens.

I am wondering if you might not have a bad antenna for UHF. Possibly RF feedback from a high SWR is affecting the radio and shutting it down. See if you can borrow another antenna from a friend.

I said there is ALMOST NEVER any reason to use Rx Tone -- and I stand by that -- recognizing that you describe the one, relatively rare, situation where Rx Tone is useful, namely when you only want to monitor one user on a shared repeater where different users use different tones and the repeater passes each of those tones through on the output (which all shared repeaters ought to, but not all actually do).

The more important point in my comment was that there IS NEVER any reason for someone to use Rx Tone when they don't understand what it is and how it works.

DID ANYONE WHO REPLIED TO MY COMMENTS ABOUT RX TONE BOTHER TO ACTUALLY READ WHAT I SAID?

Apparently the answer to this question is a resounding NO.

If you think you know what Rx CTCSS and Rx DCS are and how they work - perhaps you should have bothered reading what I said.

So far there have been many responses claiming that Rx tones are the greatest thing since sliced bread and are totally essential -- of those responses, a very few came from people who correctly described a situation where using Rx tone is both possible and useful for their specific purposes. Several other responses came from people who either don't understand how CTCSS/DCS work or who don't understand how repeaters work (or probably both).

I made two specific points in my comments:
1. Reasons to use Rx CTCSS/DCS are rare.
and
2. You should never use Rx CTCSS/DCS unless you understand what it is and how it works.

I stand behind both those comments, despite the criticism of several n00bs who need to put their ham ticket back in the cracker jacks box where they got it.

Hello, thank you all for the constructive feedback

I'll address a few of the questions now, the firmware question will have to wait, the cable is here in my office but the radio is not, strike that, I don't know where the cable is! I will look for it later.

I have tried UHF simplex, that works just fine on Full power.

I had presumed in the past that this was a programming issue, so I had downloaded the latest daily build of chirp and re-programmed last week. I could hear the lads on our local 2m repeated saying that they were at the repeater site and had just turned back on the 70cm repeater, I then switched over to that channel and for the first time I could hear our local 70cm active. I tried to call them and that was when I found that the newly re-programmed radio still didn't work on UHF.

When reprogramming I had taken a working VHF channel, and altered the frequency, shift and name. The CCTCS remains the same. We have the same tone for all the repeaters in Wales (in the UK regions have different tones, the frequency of the repeater does not duplicate in a region)

I will read the firmware later and report back.

Thank you again for the insights and the musings - all great stuff, such a great group of talented people!

Then try it from the VFO. Key in the RX frequency and set menu 25 to "+" and menu "26 to "01.600" and set menu 13 to match the require CTCSS tone.

I must confess that I've only breezed over this conversation, but will ask anyway.

Have you tried listening to your outgoing signal with either a scanner or other HT, tuned to your transmit frequency to see what you are really putting out on the air?

This would relieve you of having to enlist the use of the repeater. And, it would also possibly uncover any other strange goings-on.

BTW, you did verify that you're not locked into TX narrow on UHF?

Stan

Subject: Re: [baofeng_uv5r] repeater offset questions

Hello, thank you all for the constructive feedback

I'll address a few of the questions now, the firmware question will have to wait, the cable is here in my office but the radio is not, strike that, I don't know where the cable is! I will look for it later.

I have tried UHF simplex, that works just fine on Full power.

I had presumed in the past that this was a programming issue, so I had downloaded the latest daily build of chirp and re-programmed last week. I could hear the lads on our local 2m repeated saying that they were at the repeater site and had just turned back on the 70cm repeater, I then switched over to that channel and for the first time I could hear our local 70cm active. I tried to call them and that was when I found that the newly re-programmed radio still didn't work on UHF.

When reprogramming I had taken a working VHF channel, and altered the frequency, shift and name. The CCTCS remains the same. We have the same tone for all the repeaters in Wales (in the UK regions have different tones, the frequency of the repeater does not duplicate in a region)

I will read the firmware later and report back.

Thank you again for the insights and the musings - all great stuff, such a great group of talented people!

Emyr,

After thinking about this some more I am wondering.

I doubt this has anything to do with the 1.6 MHz shift. Why don't you program a UHF simplex channel and see what happens.

I am wondering if you might not have a bad antenna for UHF. Possibly RF feedback from a high SWR is affecting the radio and shutting it down. See if you can borrow another antenna from a friend.

Done. The radio I have is a BF-F8+, attempted to download using the
BF-F8HP setting. No response from the radio. Also tried to use the F11
and the UV-5R with no response as well.

Becasue you got one radio working I assume you found the interface from the list (probably the bottom one, called ttyUSB0.

Try changing the baud rate to 9600, with this line
stty -F /dev/ttyUSB0 9600

(nothing much will seem to happen, but it slows the interface down to 9600 which is ample for what we are doing)

It certainly doesn't hurt to do this, but it isn't necessary. The first thing the software does when cloning begins is to negotiate a connection at this speed.

Hi, there's a comprehensive guide to the radio functions and programming here,

http://www.miklor.com/uv5r/pdf/uv-5r_v1.0.pdf
http://www.miklor.com/uv5r/pdf/uv-5r_v1.0.pdf

It's a bit heavy but plough through it.
It seems they key bit is using "MENU 28" to clear the memory number first. The handset doesn't overwrite the old stored frequency you must clear the stored frequency first.

hope this helps

Paul

48492. Re: Ubuntu CHIRP and Baofeng USB cable

Yahoo group: baofeng_uv5r (2015)

You must ensure you have permissions on the device and add your user to the appropriate group for permissions. Here is the quote from the CHIRP web site:

Note that you may need to adjust permissions on the /dev/tty(something) device, or add your users who want to use Chirp to the "dialout" group in order to let non-privileged users access the serial device.
This issue is often indicated by an "access denied" error when accessing serial port.
On ubuntu, for example, this is accomplished with:

```
sudo usermod -aG dialout username
```

where username is your username. You will then need to log out and back in for it to take effect.

Hope that helps!

48493. I'm going to try this again...

Topic: 48493 Message: 48493

I use a helmet headset with my Baofeng UV-5R.
I'd like to add an amplifier and mixer to the setup, so I can also monitor my GPS while riding (and possibly add MP3 player music later as well.)
Here's a description of the components:
AMP/Mixer:
The AMP/Mixer has three inputs for, say, a GPS, MP3 player and a Baofeng Radio.
The AMP/Mixer has one output to headphones.
There's no signal prioritization on this AMP/MIXER, which is OK with me. All inputs are treated equally and heard simultaneously.
(Website for the AMP/MIXER is http://www.electric-avenues.com/amplirider.html http://www.electric-avenues.com/amplirider.html.)

The headset:
The headset, by Pryme, terminates in a two-prong, Kenwood-compatible, plug which is compatible with the Baofeng UV-5R. The MIC plug is 3.5mm; the SPKR plug is 2.5mm.
Push-To-Talk (PTT) is activated by connecting a circuit between the sleeve of the 3.5mm plug and the sleeve of the 2.5mm plug. (See the plug description on the Miklor site:
Technical Baofeng Pofung UV5R UV82 UV82X http://www.miklor.com/COM/UV_Technical.php

http://www.miklor.com/COM/UV_Technical.php

Technical Baofeng Pofung UV5R UV82 UV82X http://www.miklor.com/COM/UV_Technical.php

HIGHWAY SPM-800(B/F) Series http://www.pryme.com/index.php?l=product_detail&p=2243) Medium Duty Motorcycle Helmet Microphone: Motorcycle Helmet with Dual High Output Speakers. Available for either full or half-face helmets.

View on www.pryme.com http://www.pryme.com/index.php?l=product_detail&p=2243)
Preview by Yahoo

Usage:
Using the AMP/MIXER requires me to add an extension cable to each of the two plugs (2.5 and 3.5mm) on the Kenwood compatible headset.
The MIC plug (3.5mm) from the headset goes via male/female extension to the MIC socket on the radio.
The SPKR plug (2.5mm) from the headset goes via male/female extension to the AMP/MIXER output.
The SPKR output from the radio goes via male/male cable to the input on the AMP/MIXER.

The GPS SPKR output goes via male/male cable to the input on the AMP/MIXER.
(Optional: the MP3 player output goes via male/male cable to the input on the AMP/MIXER)

The Problem:
The PTT on the Baofeng requires a connection between the sleeves on both the 2.5 and 3.5mm plugs. The PTT switch completes the circuit between the sleeves.
Using the extension cables eliminates the PTT switch’s ability to complete that circuit.

The Solution:
Might you recommend a solution that would allow use of the AMP/MIXER and the PTT switch?

48494. Programming hit or miss (mostly miss) after programming friends baofeng Chirp

I ordered my friend a Baofeng. I use Chirp to program mine. I hooked his radio up to my PC, fired up Chirp and downloaded his image file. I then copied and pasted the settings from my image file to his image file and uploaded that to his radio. Now I cannot program my radio. When I programmed his, the channel frequencies show up on his, but not the names. When I attempt to program mine it acts like it is about to program then the display changes from orange to blue and I get a message can't communicate with radio. I am using Manjaro Linux, but get the same results when I try using windows. Any help would be appreciated. My friend's firmware is N5R-215 and mine is BFS311.

Thanks and 73

Dont forget to select channel names from the menu on your friend's radio.

I don't understand how loading your friend's radio with your image file can have done anything that now prevents you re-programing your own radio, unless you somehow polluted your own image file and you are now trying to upload that?

Read here how to download latest tarball,

"...Next, grab the source tarball from the Download page and save it somewhere like your home directory and then unpack it:
tar xzf chirp-0.1.12.tar.gz
cd chirp-0.1.12

From here, the easiest thing is to just launch CHIRP directly without installing it onto your system. Don't worry, this works just fine and CHIRP will be fully functional. Simply run the following:
./chirpw

Once you've tested that it runs on your system, you may want to install it permanently...."

I personally run it this way, haven't permanently installed it yet. I use linux mint debian, installing with package manager uses an older version that as mentioned above does not support newer radios. I couldn't get it to work until I did it manually either. I have a TYT TH9800 and a BF82 and program both with it. You may reread that site again to catch the subleties. good luck!

I am using the daily build of Chirp. I was able to plug my radio in and download the image file. For the heck of it I didn't make any changes and just tried to upload that same image to the radio. The radio back light was orange indicating transmitting but as soon as I hit upload the back light went blue and the no response from radio message appeared. I was able to program my radio all day until I programmed his radio. I have the uv5r+ and hus is the uv5r+v2. Mine has B firmware and his has N. I'm thinking my image file must have got corrupt some how. Maybe I can find a image file from some one using the same firmware as mine to work with.

First thought is a flat battery. What happens if you switch to low power
(press and release #)? Does it work in simplex/VFO mode?

Try a master reset (Menu 40) and see if the fault still occurs. If it
does and the battery is charged, it sounds like the set is faulty. Where
did you get it? If it was Sinotel, you should have no trouble with a
replacement.

thank you all for your comments and your help.

It works fine in UHF both in Simplex and in VFO modes so I will use it like that from now on.

the fault is only showing from a programmed UHF channel.

I have had direct email suggesting poor SWR on 70cm and faulty batteries, it could well be a combination of both of these problems. When I have some spare time I may do some extra tests with a dummy load. I will report my findings if I find anything untoward.

I will buy a replacement radio and keep this one in the glove box of the car as an emergency spare. They are not expensive!

Thank you all again for the constructive comments. They have all been good.

Let's put this to bed now. Thank you all again!

For those of you who are serious HF DXers, it's interesting that the crew on K1N Navassa Island are using UV-5R for local communications. While browsing the photos on http://navassadx.com I noticed http://69.89.25.185/~trexsoft/t-rexsoftware.com/k1n/photos-qrv.htm containing the photo, a cropping of which appears below. What better endorsement of these radios can one hope for?

i do not "...open my name on user dialup..."

I open a terminal and cd to my chirp directory
then type ./chirpw
chirp opens with blank page
from here, click radio, download from radio, choose mfg/radio and port
it takes a few seconds for it to download
i haven't had to use much effort to find the proper port AND I have multiple usb stuff hooked to the computer, if I get a prob, i just change ports from the dropdown list until it works

48511. Chirp/Device Menu 34 Difference

Yahoo group: baofeng_uv5r (2015)
Date: 2015-02-12 18:06:12 UTC
From: cprendon@...
Topic: 48511 Message: 48511

I have a model BFF8+ (with the horrible reversed display) running firmware BFS313 as displayed in the factory Chirp download Firmware Message A because Message B is BFS297. I have menu 7 off. In the Chirp images menu 34 is set to Off, but in the radio the only choices I have are A or B. There is no Off option in the radio menu 34. Even if I turn menu 7on I still do not get a menu 34 - Off option. If I upload the original factory image nothing changes.

According to the Jim Unroe Reference for UV5R Menus I should have an Off option in menu 34. I am probably missing something totally obvious, but I cannot see why this is at this moment. I'm sure someone here knows.

48512. Re: [baofeng_uv5r] Chirp/Device Menu 34 Difference

From: Jim Unroe
Topic: 48511 Message: 48512

There are at least 3 variations of Menu 34 now. In the original version, the selected display would always be forced to the display selected in Menu 34. The two new versions no longer force the priority to anything anymore. In my opinion, the menu 34 in those radios is now useless.

One has the settings OFF, A and B. The other only has the settings A and B. It no longer matters what you set them to because the setting always follows (or tracks) the display selected by the [A/B] key. Unfortunately Baofeng made it hard for CHIRP by having the new A equal the old OFF and the new B equal the old A as far as the bits in memory are concerned. So OFF in CHIRP would be the new A and A in CHIRP would be the new B. And like I said, it doesn't matter anyway, because when you use the [A/B] key to select the active display, menu 34 changes to match. Thanks Baofeng.

Thanks Jim. I figured you would know because of Chirp having to interface with the menus. I guess BFS313 is the last function you described. I tried it and as you said, 34 no longer has any influence. I was really puzzled because my UV82s worked fine but the BFF8+s did not.

Now if someone can get Chirp to invert the (never visible when not backlit) inverted display... ;-) I know, that is hardware...

Some people like the inverted display. I don't think I would.

At least with CHIRP you can set ABR as high as 24. The Baofeng software and older radios only go to 5 and the newer radios only go to 10).

Hello,

I am thinking of buying several of these batteries and I have some questions:

1) Amazon list two models the UV-B5 and the UV-B6. Is it correct that the B6 is the one that goes with the UV-5R radios?

2) Would these batteries still work with these colored plastic covers or one such as this one
http://smile.amazon.com/gp/aw/d/B008J1PSHW/ref=mp_s_a_1_11?qid=1423782195&sr=8-11&pi=AC_SX110_SY165_QL70&keywords=TENQ

3) Should I buy these or stick with the 3800mAh long versions. The reason why I am not so crazy about them is the fact that once installed, there are no cases that fit the radio any more.

Thanks for any insight.

No. These are radios. Not batteries. You may have your part number mixed up.

The UV-B5 and UV-B6 radios are different from the other Baofeng
radios. They are the same radio except the UV-B6 has a flashlight
instead of a rotary encoder and no alarm button. The UV-B5 has a
rotary encoder instead of a flashlight and also has an alarm button.

Neither of these radios has an extended battery available.

SX110_SY165_QL70&keywords=TENQ

What batteries? You described radios above. These radios will probably
go into the pouch.

After doing some research, the standard UV-5R battery is the BL-5. The
extended battery is also called a BL-5. The AA-cell battery case
appears to also be called the BL-5. That sure makes shopping easy.

Is that what you meant?

I believe that you are incorrect. I am pretty sure that will a little
effort you can find some extended cases.

@Display time

At least my BF-F8+ disables the backlight if I have the display time > 10s and go the the display time menu. You then need to restart the radio to get the backlight back.
I do not know the FW number from head, but it is very recent.

It also gives pulsing radio, if radio is turned on, a transmission comes in on UHF or VHF and it switches then back to radio.
This does not happen if the setting is 9 or smaller.
So I have set it to 9.

Hello All,

When I was in Hartford, CT for the ARRL's Centennial Conference, I passed by the ARRL's HQ and labs and I had my UV-5R with the ExpertPower 3800 mAH 7.4V extended Li-ion battery measured transmit output power at 5.9 Watts.

I am wondering has anyone done any comparison between different batteries like the BL-5 AA, or the regular BL-5, and I recently bought a BF-F8 HP with a 2000mAH battery, like this one (http://smile.amazon.com/gp/aw/d/B00MAULSOK/ref=mp_s_a_1_1?qid=1423854899&sr=8-1&keywords=baofeng+bf-f8hp+w+large+battery)

Hi Jim

My apologies, I did copy from Amazon and I guess they have it wrong to.

I have, now, 2 Baofeng UV-5Rs, and 2 BF-F8 HP versions, the last one came with a 2000 mAH BL-5 battery that is thicker than the other two. This is why I asked the question, because I carry a UV-5R with me at all times and I need a case to protect it from the daily bumps and kicks. Plus if I can get these colored jackets on my radios, I can visually tell which is which.

Thanks for all your contributions on this Group, you sure know your way with radios.

The power output of the radio is completely irrelevant of the amp hour rating of the batteries. The radio doesn't draw anywhere near the maximum draw capacity of the batteries you've listed.

Electrically the radio is just a resistor and follows Ohms law. Now I have seen old NiCad batteries that couldn't provide the current needed for a hand-held radio and caused their power output to drop…but you can't overdrive a radio with more amperage capacity.

You could hook up a bank of car batteries and you won't get any more power out of your radio. What you didn't do was test another battery on your radio…you would've seen the same answer.

So either your radio is putting out a bit of extra power or their measurement was wrong. What instrument did they use to measure it? Not all instruments are very accurate.

If amp hour capacity drove power output every light bulb and appliance in your house would pop given most homes now have 100 amp service.

You'll also note that as the voltage drops on the discharging battery your radio does NOT lose power. That's because as voltage drops the radio will draw more current (equaling the # of electrons required by the radio).

It's only when the energy supply can't provide enough electrons that the radio power will decrease along with the low supply.

For inexpensive, yet still good, the Leixen VV-898 puts out 10 watts on both Uhf and Vhf, for betwwen 100-150, depending on where you get it. Small radio, takes up very little space, and has good audio reports. It takes a Bnc connection for the antenna. The radio and mag mount would be a cheap starter setup.

If you want more power, any of the big names will do a good job. Alinco, Icom, Yaesu, Kenwood, Wouxun, Anytone, would all be good choices with a wide variety of price ranges and capability. If you want ham and Part 90, Wouxun, Anytone, or Powerwerx would be my choices. They all cross band repeat, also.

As Jardy has suggested, a wide variety of radios exist that will work in a mobile, but to help narrow done your selection, ask yourself a few questions first (and then share those answers).

What is my budget? If you can't afford anything over $200 (for example), there's little sense in reviewing mobile rigs that cost more than that.

What band(s) are important to me? If all of your local activity is VHF, for example, you might not "need" a dual-band radio that includes UHF. Dual-band rigs are very handy, however, especially the cross-band repeat function if you like to go camping way out in the sticks.

Are you close enough to repeaters that a 10 watt radio will be able to reach them well with just a mobile antenna? Again, if you live 50 miles from the nearest repeater and it's not mountain-top based, you may have trouble working it with just 10 watts and a mobile antenna.

Do I intend to use the radio just for ham radio, or would a type 90 commercial rig also have advantages for me? Many of the "ham only" Japanese rigs are far easier to program, but to get them to transmit out of band usually requires hardware mods that requires dealing with surface mount components that are very small. Chinese rigs are normally designed to transmit over a wider area of frequencies, but you give up the "ease of use" when field programming them, so they each have trade-offs to consider.

Where do I plan to mount my mobile antenna and what's my budget for that? Don't laugh, but I've seen folks new to radio install 1/4 wave mobile antennas with no ground, or 1/4 wave antennas mounted on back bumpers, or mount their antennas just 2-3" away from metal sides of Jeeps, effectively destroying any chance of good rf paths.

One guy in the neighborhood installed an NMO mount in the center of his Chevy Tahoe (good so far), but since it was raining he parked it inside the garage to begin measuring his SWR (not a good idea). To make matters worse, his antenna was actually touching a metal overhead storage rack the former owner had installed, which completely was screwing up his measurements.

You can have a really, really good mobile rig but if the antenna is poor, or the install/placement of the antenna sucks, you'll never have the best signal possible from that gear. It's always a good idea to spend as much time with the antenna selection and the installation of the antenna as you spend picking out the radio gear you'll attach to it. "If" the budget is really tight, I'd suggest you work on the antenna first, and also consider a good used rig that can be found at many different hamfests all over the

country.

From: Joe
Topic: 48532 Message: 48536

I'm out growing my UV-082's but they are still awesome. Since I don't use them much anymore is there a best way to store them? With phones and laptops it's best to charge them up like 70% of the way (not all the way!) and then put the battery in the fridge. That's supposed to keep any battery damage to a minimum.. Same thing here? I don't need them for prepper crazy stuff. No emergency coms and ops and weird stuff that will never happen. I just want them to last a long time.- Joe

Now I remember what I wanted to ask...can you use a sma adapter to convert this backward connector on this radio without any adverse affect....I mean swr. So you can use (standard) type handheld antennas.....and do they make a Larsen antenna for this radio..I use to love Larsen, the tru the roof antenna, that had the cover you put on when you remove the antenna..I had a Kenwood TM2550a, I think it was...got stolen from my truck..when they stole the WHOLE truck..it was all my fault that happened.. Remember that Kenwood had a display with only one digit to the far left, that showed a 5,6 ,7, and did not show all of the freq..

You are correct about battery storage being best at a mid point of charge. Most of what I have read says 40% charge is best. The radios have no way of reading battery state of charge accurately though, so find out how long a charge lasts with your radio in standby and run a fully charged battery in standby for half that time to get the partial charge state. Regardless, take the battery off the radio and put it so that if it leaks it won't damage anything. Rare for Lipo batteries, but it can happen. Take the battery out every few months and exercise it if you can as they lose charge a little over time. Even so, remember that batteries are only $100 - $15 US anyway, so the main thing is to take it off the radio. Put the radio someplace where it will be room temperature and where the humidity is not high. Anywhere indoors is likely ok but outside in a garage is not. Don't put things in sandwich bags as they give off polymer gases over time that can coat the inside of the radio parts and cause problems over the long run.

My recommendation is to buy an FTDI cable and you won't have to worry about driver issues at all. It just plugs in and works with the default driver.

But it will cost you ~$20. That's why they sell the fakes for less. You won't find a real one for much less than that.

For example:

Upgradeable firmware? That's a support nightmare waiting to happen.

You already have thousands of folks that need to be lead by the hand to get a simple programming cable to work. Can you imagine these folks all wanting to extend the frequency range (even more), or add AM or SSB with a "secret" firmware upgrade?

If Baofeng is smart, they will not allow most end-users access to firmware upgrades, and simply charge a small fee for the service. Otherwise, they had better make it brain-dead simple to perform or there will be bricked radios all over the place.

48558. BF-F8HP question

Yahoo group: baofeng_uv5r (2015)
Date: 2015-02-17 03:05:51 UTC
From: KC2RUA
Topic: 48558 Message: 48558

I have two BF-F8HP's. I noticed when radio A is attached to a j-pole it s slow to break squelch or doesn't at all. It goes blank. But it works fine on the stock antenna.

Radio B works on either antenna just fine.

Both radios were originally programmed the same. I later added two ARES repeaters to radio A using the same version of Chirp.

I don't know if radio A is malfunctioning or if I screwed up something in the programming.

Anyone have any ideas ?

Steve B. KC2RUA

I'm wondering if it's Baofeng at all. They are claiming Part 90 and 95 and the latest Baofeng FCC cert from Dec 2014 is the BF-F9V2 and it is Part 90 but not 95 and not firmware upgradable.

https://apps.fcc.gov/oetcf/eas/reports/ViewExhibitReport.cfm?mode=Exhibits <https://apps.fcc.gov/oetcf/eas/reports/ViewExhibitReport.cfm?mode=Exhibits&RequestTimeout=500&calledFromFrame=N&application_id=934315&fcc_id=ZP5BF-F9V2>
&RequestTimeout=500&calledFromFrame=N&application_id=934315&fcc_id=ZP5BF-F9V2

At least we have another Baofeng that's part 90 (just remember you can't change the antenna though and still maintain Part 90 cert – and it looks like the lousy antenna they tested it with).

The "FOUR" new radios sound a lot like it will be one (or maybe two) different circuit boards but with different firmware -- Building a dual-band MURS/GMRS radio that can be FCC approved is simply a matter of taking any of their dual band radios and writing different firmware that eliminates "field programmability" (from the keypad) and limits the frequency to exclude the ham bands -- such a radio could qualify for both Part 95 and Part 90 (but not for FRS).

From: marcrfuller@...
Topic: 48567 Message: 48567

Hey All,

So, I've wanted a BF-F8HP for a while now, but any vendors that do ship to the UK want crazy money and don't seem trustworthy. I was looking through a UK supplier for various radios today and saw this..

http://www.thunderpole.co.uk/dual-band-amateur-radios/intek-kt-980hp.html
http://www.thunderpole.co.uk/dual-band-amateur-radios/intek-kt-980hp.html

Am I right in saying this is just a Beofeng BF-F8HP clone? Anyone know if the Baofeng cable and chirp will work with it? Seems a great way to get a 8watt unit in the UK.

Any info appreciated.

Marc

Hi Marc,

Actually, the Intek KT-980HP was available, and CHIRP supported it, before the Baofeng BF-F8HP was released. So in a way you could say the BF-F8HP is a clone of the KT-980HP.

48575. Selectivity/Sensitivity

Yahoo group: baofeng_uv5r (2015)
Date: 2015-02-17 17:23:31 UTC
From: cprendon@...
Topic: 48575 Message: 48575

I recently had an experience that tells me that these radios may have some pretty poor selectivity from what I can tell.

I hook up my HT to a 3db gain j-pole outside sometimes and I usually monitor a repeater that TXs on 147.210. Recently I have been picking up traffic that sometimes is pretty clear then breaks up with lots of static mid-transmission and is slightly garbled. (off freq/ losing lock) I could even get it sometimes on my mag mount antenna in my car. I checked and there are no repeaters on that freq nearby so I switched to VFO and started incrementing and decrementing the freq until I found it. It is a repeater 70 miles away that TX on 147.095 at an elevation of 2,800 feet. That seems pretty far off freq to pick up clearly. Even raising squelch (with the Milkor modifications) to as high as 4 wouldn't reject it. I added my repeater's PL on my receive channel and that took care of it.

However it seems like a decent radio should be able to be selective enough to reject a signal off by .015Mhz that isn't right next door. Others I know do not pick up this repeater with much higher gain antennas and base stations.

Does anybody know the selectivity and sensitivity specs on these radios or how they compare to market standards like the FT60 or the like? I haven't been able to find those specs on Baofeng radios. I haven't had any problems with sensitivity. I can even pull in stations others cannot sometimes with similar antennas. Selectivity seems pretty bad from this experience.

48579. Re: [baofeng_uv5r] Selectivity/Sensitivity

Yahoo group: baofeng_uv5r (2015)
Date: 2015-02-17 18:15:36 UTC
From: Craig Carnahan
Topic: 48575 Message: 48579

A common issue with the Baofeng UV-5R product line is the lack of selectivity (including many of their cousins, like the UV-5RA, -RC, -RE, etc., etc.), or as has been discussed previously many times, to all of the Baofeng radio buyers that think FCC Part 90 acceptance also means that you can have two VHF or UHF frequencies 12.5kHz apart (or less) on your two VFO's (and not hear any other cross-channel noise or interference on the other frequency), you will need to purchase a different radio than the original Baofeng UV-5R.

Both TYT and Wouxun make radios with a far better receiver, more memories, and tons of accessories available as well, plus TYT has a few options that neither Baofeng nor Wouxun currently offer (like 20 to 25 FM radio channels and a compandered audio circuit). There are probably other better Chinese units as well (that I haven't played with yet), but there's no getting around the fact that $30-$60 Chinese radios won't compare well (in the receiver selectivity portion at least) with their more expensive Japanese competitors like the $150 Yaesu FT-60.

Someone translated the Dead Sea Scrolls and found a mention that the ancients had discovered that software defined radios with no tuned circuitry on the input tend to have poor selectivity.

From: mailto:baofeng_uv5r@yahoogroups.com

I recently had an experience that tells me that these radios may have some pretty poor selectivity from what I can tell.

Does anybody know the selectivity and sensitivity specs on these radios or how they compare to market standards like the FT60 or the like? I haven't been able to find those specs on Baofeng radios. I haven't had any problems with sensitivity. I can even pull in stations others cannot sometimes with similar antennas. Selectivity seems pretty bad from this experience.

Actually, Jardy, he did a good job of searching for something that mentioned changing antennas - but he didn't bother reading §2.1043 which is what defines the changes that need to be reported. What he did not, and apparently cannot or will not, understand is that the antenna has nothing to do with any of the measurements for which the radio is Part 90 certified. In fact, the lab measurements for Part 90 certification are made without the antenna on the radio.

The only measurement done involving the antenna is the field strength which is measured as part of the FCC's interest in RF exposure limits. The simple fact is that you are not going to get one of these HTs to even approach the exposure limit for General Population/Uncontrolled Exposure without connecting it to an antenna array more suitable for SETI than for terrestrial communications.

Publication Number: 951136 Rule Parts: 90 Publication Date: 03/23/2007
Keyword: Alternative antenna requirements for Part 90 devices

---
First Category: Radio Service Rules
Second Category: Portable - Part 2.1093

Question: Does changing the antenna for a device authorized under PART 90 of the rules require a new application?

Answer: The rules governing permissive changes to equipment subject to Certification are contained in Section 2.1043. A new application for Certification does not need to be filed when changing the antenna on a Part 90 device. A Class II permissive change may be filed for a Part 90 device using the same procedure used when changing the antenna for a Part 15 device. Please note the need for RF exposure analysis with a new/different antenna. See Section 2.1091, 2.1093.

You have to file a Class II permissive change…with RF analysis…don't believe me…believe the FCC.

https://apps.fcc.gov/oetcf/kdb/forms/FTSSearchResultPage.cfm?switch=P&id=20454

And that's only if you do NOT change the gain of the antenna. Of course they lie and claim their antenna is a simple dipole at 2.15dBi gain and we all know gains change on different antennas which is likely the reason for the permissive change requirement.

https://apps.fcc.gov/eas/comments/GetPublishedDocument.html?id=209&tn=904226

Until you have such change approved you are not authorized to transmit…so effectively you lose part 90 compliance in my book. Technically you're correct in that you don't have to get a new ID so you don't "lose" part 90...you lose authorization to transmit due to equipment change.

And if you put a Yagi on this puppy and gain something like 7dB you are quite likely going to exceed RF exposure limits…and they presumably wouldn't approve it.

Of course we hams are authorized to fry our brains…

Mike,

The antenna comment is total BS.

The antenna measurements are for the RF exposure limits -- which are completely separate from the Part 90 certification standards. Part 90 technical standards do include some power limits but (1) none of these HTs will ever come close to the Part 90 power limits; and (2) the power limits in the Part 90 rules are RF output, not ERP, so they are independent of the antenna.

Using Xaun Loc's link on radio frequency safety, I found this in the FAQs.

HOW SAFE ARE RADIO ANTENNAS USED FOR PAGING AND "TWO-WAY" COMMUNICATIONS? WHAT ABOUT "PUSH-TO-TALK" RADIOS SUCH AS "WALKIE-TALKIES?"

"Land-mobile" communications include a variety of communications systems, which require the use of portable and mobile RF transmitting sources. These systems operate in several frequency bands between about 30 and 1000 MHz. Radio systems used by the police and fire departments, radio paging services and business radio are a few examples of these communications systems. They have the advantage of providing communications links between various fixed and mobile locations.

There are essentially three types of RF transmitters associated with land-mobile systems: base-station transmitters, vehicle-mounted transmitters, and hand-held transmitters. The antennas and power levels used for these various transmitters are adapted for their specific purpose. For example, a base-station antenna must radiate its signal to a relatively large area, and therefore, its transmitter generally has to use higher power levels than a vehicle-mounted or hand-held radio transmitter. Although base-station antennas usually operate with higher power levels than other types of land-mobile antennas, they are normally inaccessible to the public since they must be mounted at significant heights above ground to provide for adequate signal coverage. Also, many of these antennas transmit only intermittently. For these reasons, base-station antennas are generally not of concern with regard to possible hazardous exposure of the public to RF radiation. Studies at rooftop locations have indicated that high-powered paging antennas may increase the potential for exposure to workers or others with access to such sites, e.g., maintenance personnel. This could be a concern especially when multiple transmitters are present. In such cases, restriction of access or other mitigation actions may be necessary.

Transmitting power levels for vehicle-mounted land-mobile antennas are generally less than those used by base-station antennas but higher than those used for hand-held units. Some manufacturers recommend that users and other nearby individuals maintain some minimum distance (e.g., 1 to 2 feet) from a vehicle-mounted antenna during transmission or mount the antenna in such a way as to provide maximum shielding for vehicle occupants. Studies have shown that this is probably a conservative precaution, particularly when the percentage of time an antenna is actually radiating is considered. Unlike cellular telephones, which transmit continuously during a call, two-way radios normally transmit only when the "push-to-talk" button is depressed. This significantly reduces exposure, and there is no evidence that there would be a safety hazard associated with exposure from vehicle-mounted, two-way antennas when the manufacturer's recommendations are followed.

Hand-held "two-way" portable radios such as walkie-talkies are low-powered devices used to transmit and receive messages over relatively short distances. Because of the low power levels used, the intermittency of these transmissions ("push-to-talk"), and due to the fact that these radios are held away from the head, they should not expose users to RF energy in excess of safe limits. Although FCC rules do not require routine documentation of compliance with safety limits for push-to-talk two-way radios as it does for cellular and

PCS phones (which transmit continuously during use and which are held against the head), most of these radios are tested and the resulting SAR data are available from the FCC's Equipment Authorization database. Click on the link for "FCC ID Search <imbed hypertext link>.". (Back to Index)

From: Xaun Loc
Topic: 48548 Message: 48602

The announcement never suggested that the "new" radio would be FRS-certified - I think they will just blow off FRS; people who don't know better won't care, and people who do know radios will recognize that GMRS radios already operate on "FRS" channels 1-7 (and I would bet that the "new" radio could be programmed for FRS 8-14 even though it wouldn't be legal). In fact, that might be the technique that BF uses to bypass the whole 95.655 problem. Suppose they submit a radio with JUST the five MURS channels programmed, and apply for MURS certification. They could submit another physically identical radio covering Part 90 (which overlaps GMRS) and apply for Part 90 and GMRS certification. The manufacturer isn't responsible for whatever users might do by 'hacking' the firmware!!

Subject: Re: [baofeng_uv5r] BaofengTech's "Big Announcement"

I have given this some thought, (be afraid, very afraid)...

If the firmware/hardware were to some how limit the power output on certain frequencies (MURS, FRS, GMRS for instance) then the manufacturer 'could' possible apply for a variance of the rules on that point.

Of course this does not address the fixed antenna issue..

Lloyd

On Tue, Feb 17, 2015 at 3:51 PM, 'Xaun Loc' xaunloc@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

At least one part of this Baofeng Tech pseudo-Announcement won't be true.
If you look carefully at the bottom of the picture you will find text in black on dark grey that says
"Part 90, Part 95a, Part 95J certified. For multi-purpose use on FCC Part 90, 95, and 97"

95a is GMRS. 95j is MURS

A radio could be certified for Part 90, and 95a (GMRS), but according to the rules it can never be certified for Part 95a (GMRS) service AND have Part 97 (ham) capability.

95.655(a) specifically states: "no transmitter will be certificated for use in the GMRS if it is equipped with a frequency capability not listed in § 95.621, unless such transmitter is also certificated for use in another radio service for which the frequency is authorized and for which certification is also required. (Transmitters with frequency capability for the Amateur Radio Services and Military Affiliate Radio System will not be certificated.)"

A radio CAN be certified for GMRS and any other radio service that requires certification, but it cannot be certified for GMRS if it is capable of operating on ham frequencies.

Even more limiting, 95.655(d) further states: "(d) No transmitter will be certificated for use in MURS if it is equipped with a frequency capability not listed in § 95.632."

Note that for MURS certification they didn't even include allowing for multiple certifications -- MURS certification is all or nothing.

Now I suppose BF might just apply for the certifications anyway -- and considering what we have seen with their earlier certifications the FCC might just approve it without bothering to check their own rules, just like they approved the UV-5R without reading 90.203(e).

Exactly. And please note the part of Jardy's message that I have highlighted

From: mailto:baofeng_uv5r@yahoogroups.com
Sent: Tuesday, February 17, 2015 19:18 PM
To: baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] Changing the antenna

Using Xaun Loc's link on radio frequency safety, I found this in the FAQs.

HOW SAFE ARE RADIO ANTENNAS USED FOR PAGING AND "TWO-WAY" COMMUNICATIONS? WHAT ABOUT "PUSH-TO-TALK" RADIOS SUCH AS "WALKIE-TALKIES?"

"Land-mobile" communications include a variety of communications systems, which require the use of portable and mobile RF transmitting sources. These systems operate in several frequency bands between about 30 and 1000 MHz. Radio systems used by the police and fire departments, radio paging services and business radio are a few examples of these communications systems. They have the advantage of providing communications links between various fixed and mobile locations.

There are essentially three types of RF transmitters associated with land-mobile systems: base-station transmitters, vehicle-mounted transmitters, and hand-held transmitters. The antennas and power levels used for these various transmitters are adapted for their specific purpose. For example, a base-station antenna must radiate its signal to a relatively large area, and therefore, its transmitter generally has to use higher power levels than a vehicle-mounted or hand-held radio transmitter. Although base-station antennas usually operate with higher power levels than other types of land-mobile antennas, they are normally inaccessible to the public since they must be mounted at significant heights above ground to provide for adequate signal coverage. Also, many of these antennas transmit only intermittently. For these reasons, base-station antennas are generally not of concern with regard to possible hazardous exposure of the public to RF radiation. Studies at rooftop locations have indicated that high-powered paging antennas may increase the potential for exposure to workers or others with access to such sites, e.g., maintenance personnel. This could be a concern especially when multiple transmitters are present. In such cases, restriction of access or other mitigation actions may be necessary.

Transmitting power levels for vehicle-mounted land-mobile antennas are generally less than those used by base-station antennas but higher than those used for hand-held units. Some manufacturers recommend that users and other nearby individuals maintain some minimum distance (e.g., 1 to 2 feet) from a vehicle-mounted antenna during transmission or mount the antenna in such a way as to provide maximum shielding for vehicle occupants. Studies have shown that this is probably a conservative precaution, particularly when the percentage of time an antenna is actually radiating is considered. Unlike cellular telephones, which transmit continuously during a call, two-way radios normally transmit only when the "push-to-talk" button is depressed. This significantly reduces exposure, and there is no evidence that there would be a safety hazard associated with exposure from vehicle-mounted, two-way antennas when the manufacturer's recommendations are followed.

Hand-held "two-way" portable radios such as walkie-talkies are low-powered devices used to transmit and receive messages over relatively short distances. Because of the low power levels used, the intermittency of these transmissions ("push-to-talk"), and due to the fact that these radios are held away from the head, they should not expose users to RF energy in excess of safe limits. Although FCC rules do not require routine documentation of compliance with safety limits for push-to-talk two-way radios as it does for cellular and PCS phones (which transmit continuously during use and which are held against the head), most of these radios are tested and the resulting SAR data are available from the FCC's Equipment Authorization database. Click on the link for "FCC ID Search <imbed hypertext link>.". (Back to Index)

Actually, Jardy, he did a good job of searching for something that mentioned changing antennas - but he didn't bother reading §2.1043 which is what defines the changes that need to be reported. What he did not, and apparently cannot or will not, understand is that the antenna has nothing to do with any of the measurements for which the radio is Part 90 certified. In fact, the lab measurements for Part 90 certification are made without the antenna on the radio.

The only measurement done involving the antenna is the field strength which is measured as part of the FCC's interest in RF exposure limits. The simple fact is that you are not going to get one of these HTs to even approach the exposure limit for General Population/Uncontrolled Exposure without connecting it to an antenna array more suitable for SETI than for terrestrial communications.

Going directly to your link, read the answer to the question.

FCC > FCC E-filing > OET Knowledge Base > OET KDB Full Text Search Result FCC Site Map

Publication Number: 951136 Rule Parts: 90 Publication Date: 03/23/2007
Keyword: Alternative antenna requirements for Part 90 devices

---
First Category: Radio Service Rules
Second Category: Portable - Part 2.1093

Question: Does changing the antenna for a device authorized under PART 90 of the rules require a new application?

Answer: The rules governing permissive changes to equipment subject to Certification are contained in Section 2.1043. A new application for Certification does not need to be filed when changing the antenna on a Part 90 device. A Class II permissive change may be filed for a Part 90 device using the same procedure used when changing the antenna for a Part 15 device. Please note the need for RF exposure analysis with a new/different antenna. See Section 2.1091, 2.1093.

You have to file a Class II permissive change…with RF analysis…don't believe me…believe the FCC.

https://apps.fcc.gov/oetcf/kdb/forms/FTSSearchResultPage.cfm?switch=P&id=20454

And that's only if you do NOT change the gain of the antenna. Of course they lie and claim their antenna is a simple dipole at 2.15dBi gain and we all know gains change on different antennas which is likely the reason for the permissive change requirement.

https://apps.fcc.gov/eas/comments/GetPublishedDocument.html?id=209&tn=904226

Until you have such change approved you are not authorized to transmit…so effectively you lose part 90 compliance in my book. Technically you're correct in that you don't have to get a new ID so you don't "lose" part 90...you lose authorization to transmit due to equipment change.

And if you put a Yagi on this puppy and gain something like 7dB you are quite likely going to exceed RF exposure limits…and they presumably wouldn't approve it.

Of course we hams are authorized to fry our brains…

Subject: Re: [baofeng_uv5r] BaofengTech's "Big Announcement"

Mike,

The antenna comment is total BS.

The antenna measurements are for the RF exposure limits -- which are completely separate from the Part 90 certification standards. Part 90 technical standards do include some power limits but (1) none of these HTs will ever come close to the Part 90 power limits; and (2) the power limits in the Part 90 rules are RF output, not ERP, so they are independent of the antenna.

When you look for a cable, you can look for a 2-pin cable that is sold to work on a Baofeng, or Wouxun, or Kenwood radio, etc. But don't buy a "genuine" Baofeng programming cable. It will have a "counterfeit" USB-to-Serial chip in it. You want to avoid that.

If you don't already have a programming cable, then what you want to look for is a 2-pin programming cable for a Baofeng, Wouxun, Kenwood radio that has the FTDI chip in it. You can find them on Amazon and eBay.

Yes, you can find programming cables that contain the unauthorized chip copy for 1/3 the price of a programming cable with the FTDI chip, but to most people, avoiding the frustradion of installing older drivers to coax it to work vs. just plugging it in and it "just works" is worth the price difference.

You should know that it doesn't have the hardware to do AM and SSB and I doubt to could get an extended range any more than the present units can, so your argument has no foundation. The only real problem is that these idiots will come here to find out how to do what you suggest, and be very annoying.

Topic: 48611 Message: 48617

Yup…you're correct…just tested it.

I used a 1uV carrier at 144.220MHz.

I've got my custom squelch on my BF-F8HP at 0,1,8,16,24,32,40,48,56,64

Note these dB numbers are not calibrated so are approximate…

Feeding in a 1uV signal at level 7(48) I can toggle squelch with 1dB attenuation.

Dropping to 6(40) It drops another 8dB to break squelch.

Dropping to 5(32) it drops another 5dB to break squelch.

Dropping to 4(24) it drops another 5dB to break squelch.

Dropping to 3(16) it drops another 5dB to break squelch.

Dropping to 2(8) it drops another 5dB to break squelch and is really getting noisy

Dropping to 1(1) I have almost 80dB total attenuation on the 1uV and it still breaks squelch. So perhaps 1 isn't a good number as it might be way too sensitive.

I may yank out the oscope and verify these numbers and check a UV-5R too and produce a curve for the squelch sensitivity.

Thanks

Mike W9MDB

Hello All

This has been an enlightening conversation thread. I think that for me, output transmit power is the feature I would like to see most attention given to.

If the radio can do GMRS or FRS, or whatever feature they might add, I still would like to see a stable 8 to 10 watts output transmit power, with a decent antenna and battery.

Battery life comes 2nd but so far the available models perform well enough to be practical for me.

I am not sure how amateur/GMRS/FRS frequencies in one radio matter that much other than making it readily available to more purchasers. You are limited to transmit on one frequency at a time any ways.

My 2 cents.

"To break squelch, only a dead carrier is needed. Frequency modulation is not required."

That's what I thought.

I used the same antenna. It's a 5/8 wave mag mount mobile. I'm not in a good reception area, and I couldn't get anything with the ducky on the UV-5R or my scanner. And even with the mobile, I don't get much sitting in my driveway. So I hooked my mag mount in my minivan, and listened for a couple of weeks to see which repeaters were strong and had the most traffic. On the strongest repeater, my scanner works great, but my UV-5R doesn't.

Thanks Bryce

Fast response. Do you know who is it manufactured by?

I believe it is a A-V85

It looks very similar to the Baofeng A-V85 antenna that comes on the UV-82, the BF-F8HP and the UV-5R radio variants sold by the better dealers.

Ok. 1uV is about -107dBm. So I should have seen the squelch break at
-100, -90, -80, etc. Correct?

Looks like mine might be defective.

A-V85. It is a step up from the standard A-5R.

---In baofeng_uv5r@yahoogroups.com, <wn6wjn@...> wrote :

Hello All Baofeng Enthusiasts

I am wondering does this antenna have any model number:

http://www.amazon.com/SunFounder-ANTENNA-136-174-400-520MHz-BAOFENG/dp/B00CCEL7O0/ref=sr_1_10?ie=UTF8&qid=1424302072&sr=8-10&keywords=uv5r+antenna http://www.amazon.com/SunFounder-ANTENNA-136-174-400-520MHz-BAOFENG/dp/B00CCEL7O0/ref=sr_1_10?ie=UTF8&qid=1424302072&sr=8-10&keywords=uv5r+antenna

Like the Nagoya NA-771 or Nagoya NA-701 or Nagoya NA-810.

Does the link to that antenna has a number?

Thanks

Subject: Re: [baofeng_uv5r] Intek KT-980HP

When you look for a cable, you can look for a 2-pin cable that is sold

to work on a Baofeng, or Wouxun, or Kenwood radio, etc. But don't buy

a "genuine" Baofeng programming cable. It will have a "counterfeit"

USB-to-Serial chip in it. You want to avoid that.

If you don't already have a programming cable, then what you want to

look for is a 2-pin programming cable for a Baofeng, Wouxun, Kenwood

radio that has the FTDI chip in it. You can find them on Amazon and

eBay.

Yes, you can find programming cables that contain the unauthorized

chip copy for 1/3 the price of a programming cable with the FTDI chip,

but to most people, avoiding the frustradion of installing older

drivers to coax it to work vs. just plugging it in and it "just works"

is worth the price difference.

48636. Antenna testing

Yahoo group: baofeng_uv5r (2015)
Date: 2015-02-19 03:56:37 UTC
From: dwb2808@...
Topic: 18645 Message: 48636

I have been testing antenna's for the Baofeng with my analyzer. I have not found 1 thay tests good at all.
With that said I wont your opinion about testing the antenna. I bought a couple of connectors that allowed me to connect the antenna to the connection on my analyzer. I have an MFJ 266C. Is that going to give me a good test?
I felt like the analyzer would look like the radio electrically.
Please reply
Dave
KD0TUN

I've been using a pair of Tram 1185 mag mounts with my UV82L Buttfangs. They are great! I get about 1.3-1.6 SWR on them using my Redot 1050a SWR meter. On my car is 1.28:1 Inside house by walls and ceiling is 1.6:1 I don't have adapters to test my Nagoya 711 antennas yet. But they probably stink. Any antenna that comes free on a <$50 radio isn't going to rock.

48642. 220 Mhz Baofeng?

Yahoo group: baofeng_uv5r (2015)
Date: 2015-02-19 06:14:33 UTC
From: L L bahr
Topic: 18645 Message: 48642

Reading stuff in the files, it says Baofeng makes a 2m/220 radio in the UV-5R package. It is called a UV-5RAX. Looking everywhere including Baofeng, Amazon, and Ebay, they all show this UV-5R AX model to be a 2/440 radio. I could find no mention anywhere where there was a 220 Mhz model of the UV-5R variant. Did they make one at one time and then stop selling it?. For the life of me, I can't figure out Baofeng models and variants. Sure would like to buy a 220 Mhz version of this UV-5R.

I don't know if Baofeng is still making some of the 2/220 UV-5R models, but they do have a 2/220 UV-82 model available, plus TYT has a 220/440 HT that I really like.

From: Marc Fuller
Topic: 48567 Message: 48654

When I purchased my UV-5R I purchased a legitimate Beofeng one, but used the drivers from Miklor. It's worked flawlessly so far.
AND, have now received the Intek KT-980HP. Plugged it it, selected the model from CHIRP and bang.. all programmed up with no fuss!
So far a great little radio... not been anywhere to try it yet, but looking promising.
Cheers
Marc

Subject: Re: [baofeng_uv5r] Intek KT-980HP

When you look for a cable, you can look for a 2-pin cable that is sold

to work on a Baofeng, or Wouxun, or Kenwood radio, etc. But don't buy

a "genuine" Baofeng programming cable. It will have a "counterfeit"

USB-to-Serial chip in it. You want to avoid that.

If you don't already have a programming cable, then what you want to

look for is a 2-pin programming cable for a Baofeng, Wouxun, Kenwood

radio that has the FTDI chip in it. You can find them on Amazon and

eBay.

Yes, you can find programming cables that contain the unauthorized

chip copy for 1/3 the price of a programming cable with the FTDI chip,

but to most people, avoiding the frustradion of installing older

drivers to coax it to work vs. just plugging it in and it "just works"

is worth the price difference.

It was 36c here today, working up to 40c or so for Sunday. What was that about an ice age? And no, it never gets cold enough for ice or snow around here lol.

Never seen one in Oz, but that’s probably not surprising, 220mhz is not a ham band in Oz (TV IIRC)

Reading stuff in the files, it says Baofeng makes a 2m/220 radio in the UV-5R package. It is called a UV-5RAX. Looking everywhere including Baofeng, Amazon, and Ebay, they all show this UV-5RAX model to be a 2/440 radio. I could find no mention anywhere where there was a 220 Mhz model of the UV-5R variant. Did they make one at one time and then stop selling it?. For the life of me, I can't figure out Baofeng models and variants. Sure would like to buy a 220 Mhz version of this UV-5R.

Topic: 48548 Message: 48657

A better OEM antenna would be nice but increased power is nothing but a waste of battery power. The difference between the 5W of the UV-5R family and the 8W of the "high power" models might make a very small difference for about 1% of users -- a difference that they could easily exceed just by being willing to use a better antenna. Power on VHF & UHF FM is nearly meaningless, and a less than 2dB increase in power (or even the 3dB you are asking for) is not going to accomplish anything useful for 99% of users.

Subject: Re: [baofeng_uv5r] BaofengTech's "Big Announcement"

Hello All

This has been an enlightening conversation thread. I think that for me, output transmit power is the feature I would like to see most attention given to.

If the radio can do GMRS or FRS, or whatever feature they might add, I still would like to see a stable 8 to 10 watts output transmit power, with a decent antenna and battery.

Battery life comes 2nd but so far the available models perform well enough to be practical for me.

I am not sure how amateur/GMRS/FRS frequencies in one radio matter that much other than making it readily available to more purchasers. You are limited to transmit on one frequency at a time any ways.

My 2 cents.

I bought one of the 2m/220 UV-5RAX from Radio Mart when they first came
out. Radio works fine, and the transaction went fine. YMMV, of course.

C'mon, Xuan, why spoil their fun? They dump extra money for MORE POWER for the BF-F8HP (where the increased signal is primarily due to the better antenna - as opposed to the standard antenna on the original UV-5R) and you start talking real world performance. Why, next thing you'll be telling me is that Baofeng Tech's "analysis" of other radios (that they don't sell) is somehow suspect as well? (Insert grin here).

48683. Re: [baofeng_uv5r] 220 Mhz Baofeng?

Yahoo group: baofeng_uv5r (2015)
Date: 2015-02-19 16:50:56 UTC
From: Bob Clabaugh
Topic: 18645 Message: 48683

There is a 220 UV-5RAX - I have one in my hand right now that I use for my 224.920 repeater.

There is only one place that sells the UV-5RAX 220 version - if I remember correctly it's Radio Mart. I can go back through my records and verify that's where I bought it. I think it was a special edition just for them.

The other Baofeng 220 I have is the UV-82X which is a better radio than the UV-5RAX, in my opinion.

Thanks,

Bob Clabaugh

The "B" is the faceless. The "X" adds 1.2Ghz

If you use HRD or DXLab, The front panel is redundant.
If you need desk space for the computer monitors, then the TS-B2000
might be just what you need.

48691. Re: [baofeng_uv5r] 220 Mhz Baofeng?

Yahoo group: baofeng_uv5r (2015)
Date: 2015-02-19 20:03:37 UTC
From: L L bahr
Topic: 18645 Message: 48691

So the consensus is Baofeng no longer makes a 220 version of the UV-5R radio. As for Radio Mart, if he was the only still selling them, I would pass, He is on my Banned List!

That said what about this idea: I buy another regular UV-5R and set it to 440 Mhz band. Then I install a 3.6 volt battery on the thing. (Half Voltage.) Maybe this would slow the "Flywheel" down to half speed and the thing would now operate on 220 Mhz. (I know the built in flashlight would only be half brightness, but I don't use that feature anyway!) (Flywheel noise would be reduced too as a secondary benefit.) (If the battery idea has a flaw, maybe a flywheel break would work.)

Any thoughts on this? Remember I thought of it first and should get full credit for the inventions.

Lee, w0vt

PS: In the event my idea has a stumbling block, sure hope Baefeng again offers a 220 version UV-5R from time to time.

Lee, w0vt

Reading stuff in the files, it says Baofeng makes a 2m/220 radio in the UV-5R package. It is called a UV-5RAX. Looking everywhere including Baofeng, Amazon, and Ebay, they all show this UV-5RAX model to be a 2/440 radio. I could find no mention anywhere where there was a 220 Mhz model of the UV-5R variant. Did they make one at one time and then stop selling it?. For the life of me, I can't figure out Baofeng models and variants. Sure would like to buy a 220 Mhz version of this UV-5R.

Lee, w0vt

48692. ADD S meter for direction finding use?

Yahoo group: baofeng_uv5r (2015)
Date: 2015-02-19 20:18:37 UTC
From: phillip.mcgroin@...
Topic: 48692 Message: 48692

I searched but saw nothing on this topic. I have seen the software radio chip used does support an S meter type function; I cannot tell from the schematic which pin it may be.

I recently got in to DJI phantom 2vision + drones.... they sometimes fly off.... so I am putting a small beacon in it to DF track it in case.... my beacon is on 440mhz, my tape measure antenna is ready to go, but most of my HT's are 2 meter! All my portable scanners are like my UV3 and UV5 radio - no S meter.

So. Has anyone brought out an S meter sig to use?

48694. Antenna fuss?

Yahoo group: baofeng_uv5r (2015)
Date: 2015-02-19 20:26:59 UTC
From: Cougercat
Topic: 48694 Message: 48694

Last night, I did a SWR / Frequency / impedance test with various antennas. The setup consisted of a Comet CAA-500 antenna analyzer with the correct adapters on the connectors to mate with the various antennas tested. The body of the analyzer is approx. as large as a HT radio. Here are the results:

Stock Baofeng F8HP antenna:

FREQ - Mhz SWR
IMPEDANCE

142 1.4:1
30 ohms

146 2:1
80

150 5:1
120

170 10:1
100

420 4:1
12.5

440 4.5:1
12.5

450 5:1
12.5

460 4.5:1
20

480 3:1
25

510 3.5:1
20

Nagoya NA-771 ☐ says it is a ¼ wave at 144mha & ½ wave at 430mhz. the 430mhz element measures 8 ½ inches over a 6 1/2 inches and the 146 element measures 15 inches.

136 1:1
40

140 1.25:1
50

144 2:1
70

148 2.5:1
70

440 7:1
12.5

465 5:1
12.5

Motorola XTS2500 UHF Antenna ☐ measures 5.25 inches

420 7:1
10

450 10:1
12.5

480 6:1
25

510 3.5:1
30

Motorola MTS2000 800 MHZ antenna ☐ measures 7 inches

420 4:1
12.5

440 5:1
12.5

450 4:1
12.5

460 3.5:1
20

470 3:1
25

510 6:1
12.5

Next, a field strength meter was used to determine if the Nagoya NA-771 antenna had any gain as it should have.

Using the Baofeng F-8HP as a signal source set to 1 watt, it was placed 2 feet away from the field strength meter. The field strength meter was attached to a pole where it could slide vertically up and down.

What was found was not surprising. The Nagoya antenna which is advertised as a ½ wave at uhf and a ¼ wave at vhf performed very close to the stock radio antennas and even performed slightly worse. When compared to a true Larsen dual band antenna placed on a suitable ground plane, which should have gave comparable results, the Larsen measured about 2.75 times the amount of radiated power as the Nagoya antenna.

Disclaimer: The varying impedances at the various frequencies were not taken into account when performing the field strength tests.

If your P2V+ is flying off so often that you need to put a beacon in it then either it's broken, and you're not pre-flighting it properly. Make sure all the firmware is up to date. Make sure you calibrate the compass before every flight. Make sure the IMU has been calibrated. Make sure all batteries are charged (Radio, Wifi Extender, phone..or whatever you're using, and main battery) And if you're not already doing this.....switch to Naza mode, which will allow you to get out of GPS mode along with some other cools stuff. More info here: http://www.pattayadays.com/2014/03/naza-mode-on-the-phantom-2-vision/

What you have shown is a vertical needs a decent ground plane as shown by the remote Larson. I bet if you installed a 19 inch long wire to ground on the handheld and let it dangle, you would see a BIG difference in field strength and the longer antenna would now shine.

Last night, I did a SWR / Frequency / impedance test with various antennas. The setup consisted of a Comet CAA-500 antenna analyzer with the correct adapters on the connectors to mate with the various antennas tested. The body of the analyzer is approx. as large as a HT radio. Here are the results:

Stock Baofeng F8HP antenna:

FREQ - Mhz	SWR	IMPEDANCE
142	1.4:1	30 ohms
146	2:1	80
150	5:1	120
170	10:1	100
420	4:1	12.5
440	4.5:1	12.5
450	5:1	12.5
460	4.5:1	20
480	3:1	25
510	3.5:1	20

Nagoya NA-771 – says it is a ¼ wave at 144mha & ½ wave at 430mhz. the 430mhz element measures 8 ½ inches over a 6 1/2 inches and the 146 element measures 15 inches.

136	1:1	40
140	1.25:1	50
144	2:1	70
148	2.5:1	70
440	7:1	12.5
465	5:1	12.5

Motorola XTS2500 UHF Antenna – measures 5.25 inches

420	7:1	10
450	10:1	12.5
480	6:1	25
510	3.5:1	30

Motorola MTS2000 800 MHZ antenna – measures 7 inches

420	4:1	12.5
440	5:1	12.5
450	4:1	12.5
460	3.5:1	20
470	3:1	25
510	6:1	12.5

Next, a field strength meter was used to determine if the Nagoya NA-771 antenna had any gain as it should have.

Using the Baofeng F-8HP as a signal source set to 1 watt, it was placed 2 feet away from the field strength meter. The field strength meter was attached to a pole where it could slide vertically up and down.

What was found was not surprising. The Nagoya antenna which is advertised as a ½ wave at uhf and a ¼ wave at vhf performed very close to the stock radio antennas and even performed slightly worse. When compared to a true Larsen dual band antenna placed on a suitable ground plane, which should have gave comparable results, the Larsen measured about 2.75 times the amount of radiated power as the Nagoya antenna.

Disclaimer: The varying impedances at the various frequencies were not taken into account when performing the field strength tests.

Subject: Re: [baofeng_uv5r] BaofengTech's "Big Announcement"

C'mon, Xuan, why spoil their fun? They dump extra money for MORE POWER for the BF-F8HP (where the increased signal is primarily due to the better antenna - as opposed to the standard antenna on the original UV-5R) and you start talking real world performance. Why, next thing you'll be telling me is that Baofeng Tech's "analysis" of other radios (that they don't sell) is somehow suspect as well? (Insert grin here).

On Wed, Feb 18, 2015 at 10:20 PM, 'Xaun Loc' xaunloc@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

A better OEM antenna would be nice but increased power is nothing but a waste of battery power. The difference between the 5W of the UV-5R family and the 8W of the "high power" models might make a very small difference for about 1% of users -- a difference that they could easily exceed just by being willing to use a better antenna. Power on VHF & UHF FM is nearly meaningless, and a less than 2dB increase in power (or even the 3dB you are asking for) is not going to accomplish anything useful for 99% of users.

Subject: Re: [baofeng_uv5r] BaofengTech's "Big Announcement"

Hello All

This has been an enlightening conversation thread. I think that for me, output transmit power is the feature I would like to see most attention given to.

If the radio can do GMRS or FRS, or whatever feature they might add, I still would like to see a stable 8 to 10 watts output transmit power, with a decent antenna and battery.

Battery life comes 2nd but so far the available models perform well enough to be practical for me.

I am not sure how amateur/GMRS/FRS frequencies in one radio matter that much other than making it readily available to more purchasers. You are limited to transmit on one frequency at a time any ways.

My 2 cents.

"Turn off menu 35 and report back if the "picket fencing" stops."

Ok, I turned off menu 35... and it had no effect.

However, I have a little more information on the problem. This morning on my way in to work, I listened in on the "strong" repeater I mentioned, 145.33. A couple of folks had a nice long conversation, and I noticed that when I was stopped... no picket fencing. But as soon as I started moving, the picket fencing started. I'm guessing that varying input signal levels are causing this. However again... after the traffic on 145.33 died down, I scanned for traffic on other repeaters, and found some on 147.22. On this repeater, there was no picket fencing. When stopped, it seemed about the same as the 145.33 machine (when stopped), but when moving, there MAY have been an increase in the noise, but the noise level wasn't constant, even when I was stopped, so it was hard to tell.

Almost seems like the radio likes 147.22 better than 145.33, because I don't notice this difference on my scanner.

If you using an external antenna, your antenna is bouncing back and forth. Try to tighten it on the mount or get a stiffer antenna.

This may be the same or similar to the receive problem I and somebody else posted about a few weeks ago.

Menu 35 has absolutely no effect on receive. It enables or disables the 55 Hz PL STE tone and 134.4 Hz DCS turnoff code.

I had a similar problem and I was using an external antenna on a mag mount. My fix was to test the coax on the mag mount with an antenna analyzer. I found an intermittent open on one end by testing while moving the coax. I replaced the entire coax run and the problem went away. Just one possibility.

Charger for that neat charge port on the Bofeng BL-5L 380mah battery.

AMAZON and many others selling the cigarette plug charger cord.

They say IT'S GREAT, IC controlled charging, protected voltage, etc, etc, blah, blah.
All BS!

Got 3 different ones, especially form AMAZON and all they are is a straight wire from the cigarette lighter to the radio.

Only circuitry is a resistor to make the LED light up.

Total Ripoff and dangerous to your battery and your radio.

I did find the right one from Battery Space and it takes in 11 to 35 vc.
Puts out 8.6vdc like it should.
If the current draw falls below 150ma (which means the battery is charged) then it turns off.
It cost around 18USD but it's worth it.
All of the others are Crap and will ruin or even blow up your battery.
:-)

Anybody else got a REAL regulated charger for the car cigarette lighter socket.

What a bummer! I just ordered a couple from Amazon. I'll check them out once they arrive and ship them back if they are putting 12 volts into their output cord. I'll also let the group know what I find out once they arrive. If they are really putting out 12 volts into a 7.2 volt battery, they sure would cook them in short order. I can see them also ruining a radio if the battery opens up and you then would be pumping 12 volts into the radio.
More to follow. (I ordered two of them from Amazon a couple days ago.)

Ok, then the effect I'm seeing probably has another name. However, wave addition and cancellation has the effect of variation of the input signal, which is what I think I'm seeing.

Well I did a little investigating on what I have ordered from Amazon! I don't have to wait for them to arrive because you are right, they pump 12 volts into whatever you hook them too! If you read some of the answers to questions sent, you will see they get around all this by saying you need to plug their output cable into your BASE UNIT CHARGING BASE! Of course then the bas will knock the voltage down to the correct charging voltage of around 8.1 volts. Who in the world is going to put their base charger unit into the car? Not me. You would see everything flying when you went around a corner. All they are giving you is the cigarette lighter plug, some wire and a 2.5mm male plug which can be used to make up a proper car charger with additional electronic parts. No way do you want to plug this thing into a battery pack.

If your P2V+ is flying off so often that you need to put a beacon in it then either it's broken, and you're not pre-flighting it properly. Make sure all the firmware is up to date. Make sure you calibrate the compass before every flight. Make sure the IMU has been calibrated. Make sure all batteries are charged (Radio, Wifi Extender, phone..or whatever you're using, and main battery) And if you're not already doing this.....switch to Naza mode, which will allow you to get out of GPS mode along with some other cools stuff. More info here: http://www.pattayadays.com/2014/03/naza-mode-on-the-phantom-2-vision/That's funny! Thanks, I enjoyed it!
You seem to have an idea about phantoms and fly offs since you called it P2V+.... So you should have a clue that there is typically only ONE (1) fly off and then your baby is gone forever. So saying someone 'often' has fly offs is really funny!
The object of a beacon is to be able to find it AFTER that fateful flyoff. Hence my building a DF beam to track my little puppy should it ever decide to be bad....
BTW, suggesting to calibrate the compass EVERY flight is really really bad advice! This MAY be a major cause of flyoffs; if one has a calibrated compass and it works today, it should work tomorrow and the next day also within miles of the same location. When you calibrate, you take the chance of it getting confused and leaving you will an badly uncalibrated compass that MAY cause a flyoff. So I would recommend just the opposite: it it ain't broke, don't try to fix it.
Thanks again for the entertainment!

Hi Mike,

I believe that the Larsen P/N is NMO 2/70SH, which is rated for 2 dbi gain on VHF and 4 dbi at 440mhz. It□s total length is 19 inches which is closer to a ¼ wavelength at vhf than the Nagoya is at 15 inches. The Larsen also read very close to 50 ohms across the amateur band.

If our radios want to see an antenna impedance of 50 ohms, we appear to do more harm in purchasing (over-priced fancy eye poking) antennas that are not properly cut to the correct length or are at impedances which are either many times lower or higher than our radios are tuned for.

To be fair to the sellers, we should note that IF the cable actually does contain any active circuitry it would be necessary to test the output voltage across a load, not just with a voltmeter at the output connector. No voltage regulator works without current flowing and the impedance of a voltmeter does not allow enough current for most voltage regulators to work properly.

If you got them from Amazon on any listing that is "Fulfilled by Amazon" you may very well get two different cables.

When Amazon decides that multiple sellers are all selling the "same item" they just mix all the stock together in the warehouse. The seller whose name was on the listing you bought from gets credit for the sale and gets their money (after Amazon takes their cut), BUT the item that you actually get might have come from any of the sellers.

Amazon rules for FbA specifically forbid the seller from including any identifying markings on or in the item package so no one can know which seller's item you actually received. This isn't a serious problem for products that are consistent; but it is a BIG problem for many products from overseas (especially from China) where dozens of small factories crank out copies of each others products.

Charger for that neat charge port on the Bofeng BL-5L 380mah battery.

AMAZON and many others selling the cigarette plug charger cord.

They say IT'S GREAT, IC controlled charging, protected voltage, etc, etc, blah, blah.
All BS!

Got 3 different ones, especially form AMAZON and all they are is a straight wire from the cigarette lighter to the radio.

Only circuitry is a resistor to make the LED light up.

Total Ripoff and dangerous to your battery and your radio.

I did find the right one from Battery Space and it takes in 11 to 35 vc.
Puts out 8.6vdc like it should.
If the current draw falls below 150ma (which means the battery is charged) then it turns off.
It cost around 18USD but it's worth it.
All of the others are Crap and will ruin or even blow up your battery.
:-)

Anybody else got a REAL regulated charger for the car cigarette lighter socket.

Hoping you might be able to save me mistakes, both practical and fiduciary.

The setup is a motorcycle top box. (http://www.bestemusa.com/Bestem-Quick-Release-T-Box-929-Top-Box-Flat-Black_p_1039.html) to which I would mount a Larsen NMO2/70B on the side of the top box.
The Larsen hinges, so I could swing it forward, parallel to the bike's frame, when parked and covered.

The coax I'm thinking of getting is the Tram 1252-SMAF. I've read that the extra coax should be coiled in a figure-8. I would attach it to the lid of the top box. The radio will live in the top box.

I've also read this, perhaps here?: "recommend a SMA-F to BNC-F adapter, and a BNC-M to SO-239 pigtail made with RG316. The SMA to BNC adapter eliminates the wear and tear of frequently screwing and unscrewing the connector to the radio. "

Obviously, where the quotation reads BNC, I would substitute whatever coax end-fitting the Collective recommends. Is the idea of the pigtail something you would recommend?
Are there other fittings you think would better serve my application?
I've thought about attaching the antenna using a "roof rack" mount attached to the passenger hand-grab. But the top box extends over the handles. I've also thought of a simple piece of aluminum, 1"x1.4"x6 extending out one side of the bike, with a hole for the NMO mount and the radio in a tank bag, not the luggage.

OK: your thoughts? And thanks.

The antenna needs a ground plane to work properly. I think this box is fiberglass and not metal. If I were to us it, I'd line the inside cover with aluminum foil glued to the top's inside. Make sure the coax shield has continuity to this aluminum. It should then work much better. Verticals fed on the end need a ground plane of some sort for a return. This is why antennas on hand helds don't work the best as there is very little counterpoise. To make things worse, radios like the UV-5R are so small they have even a smaller ground return then the larger handhelds. If you have a bracket holding the antenna which is grounded to the bike frame, well then this will be your ground return.

The coax part is a BIG subject. Basically, short is best. If you must coil it up that is OK as the extra amount of feed line won't make much difference in extra loss. Keep 1/8th inch coax as short as possible or avoid it if possible as it has more loss then a larger piece of coax. Winding it in a figure 8 won't do anything for you except help you from kinking the wire especially if it has a solid center conductor. If you kink it, this can have the effect of moving the center wire from being concentric with the outer shield. If this happens you wind up with a permanent impedance "bump" . Adapters work, but can be trouble areas. They also can inject some loss or impedance bump but how much if any depends on the quality of the connector. Make sure all exposed to weather connectors are well protected. You don't want moisture creeping into the coax with capillary action. Once the conductor has been corroded, your losses will always be higher. One last thing. If the feed line wire will be flexed a lot, make sure the center conductor is multi-stranded and not a solid conductor. Over time the flexing will hollow out the insulation between center conductor and outer brade which will disturb your impeda nce of the cable.

Interesting. I'm a little bit familiar with the ground plane necessity. One reason I chose the Larsen is that it is, with the Baofeng's frequencies, functionally a non-ground plane antenna, which is why I chose it for the motorcycle.
Others have used it with, with various HTs and mobiles, on motorcycles, with success.
confused I am!

You can change the length of an antenna to change the impedance which will affect your SWR. I'm sure that is what Larson is doing if they say you don't need a ground plane. (They are saying they are giving you a 50 ohm feed point.) You also don't need a ground plane for any vertical. However you may not be seeing a 50 ohm input impedance either. ALSO: You are not getting the best radiation efficiency out of the antenna either! SWR is only part of the story. Antenna efficiency is another part of the story. As for "gain", all I can say is the other half of the story is, "compared to what?" Maybe they are comparing it to a dummy load! When I install an antenna I am usually looking for performance and not just a low SWR. The bottom line is if you have a vertical fed at the base with no ground return you don't have the best efficiency and performance would be enhanced with a ground plane.

Most reputable vertical antennas that are advertised as not requiring a groundplane are actually end-fed half wave antennas, with impedance transformation built into the feed end.

Thanks; I get your point and recognize the inevitable compromising that all antennas (ok, most, not all!) are.
And Bill:
I'm pretty sure what you're describing is exactly what the Larsen folk have done with this antenna.
I'm looking for an acceptable compromise antenna for my motorcycle that will give me good, clear comms with a friend on another bike, usually .5 to 3 miles away. So I'm not needing to-the-moon capabilities. If I were, I wouldn't use using the Baofeng.

Twas I. Multipathing was the consensus. Worse at 440 than 144/145 and worse the faster your move and worse with even slightly weaker signals or lesser gain antennas. Nearby repeaters very good and distant ones very bad. After the discussion we had a few weeks ago I upgraded my mobile antenna by about 2db and all signal static and cutout got WAY better.

What sort of adapter you need depends both on what you are connecting together and on how you plan to use the radio.

Perhaps a little explanation of the WHY's behind the suggestions you found will help you...

The notion of putting a BNC pair between the antenna/coax and the radio was intended to allow the radio to be used connected to a base or mobile antenna some of the time and to be uses as a handheld at other times without constantly screwing and unscrewing the SMA-F connector at the radio.
That configuration would be something like

ANTENNA -> Coax with BNC (or BNC adapter) -> BNC-SMA-F Adapter -> RADIO

In that suggested configuration the operator would use a BNC antenna on the radio when using it as a handheld. That way the SMA-F connector on the radio is never screwed/unscrewed after being initially installed.
If the radio is not going to be repeatedly connected and disconnected, there is no reason to add the BNC connectors.

You say "The radio will live in the top box" -- if you mean that is the only place where the radio will be used (presumably with some sort of headset and PTT connection), then there is no reason to add the BNC connectors

You mention coiling the extra coax in a figure-8 pattern. The purpose of that suggestion is to tell you to NOT coil the extra coax in a coil (which would act as an inductor). The idea of a figure-8 is that the opposite direction loops cancel each other out (this isn't 100% true, but it is close enough)

Generally the best answer is to not have any significant amount of extra coax unless there is a very good reason. Just because an antenna comes with 15-20 feet of coax does not mean that you have to keep that coax between the antenna and the radio (note there are a few antenna designs that DO involve the coax as part of the antenna, but I can't think of any mobile antenna of that sort -- and certainly not the Larsen NMO2/70B mobile antenna you plan to use). If you are going to have the antenna mounted to the box and the radio in the box, you probably only need about 1 foot of coax. The Larsen NMO2/70B does not include the required NMO mount (although some places sell the antenna and mount together as a package). Personally I would shorten the coax down to just what you need. If you aren't familiar with cutting and installing coax and connectors, any competent radio shop can certainly do it for you - as could most older hams.

The coax from the antenna will probably come with a PL-259 connector (some sellers may offer a choice of other connectors, or if you deal with a radio shop to shorten the coax they can install any connector you prefer).

The radio itself requires an SMA-F connector -- but even if you have a choice of connectors for the coax from the antenna, it is probably NOT a good idea to connect the coax directly

to the radio (see why below)

The antenna connector on these radios is supported directly by its solder connection to the circuit board, not by any rigid mounting to the body of the radio - thus excessive strain and vibration would tend to break the connector loose from the circuit board

Normally the coax from any antenna will have a PL-259 or a BNC connector -- this requires some sort of adapter between the connector on the coax and the connector on the radio. Such adapters come in two general kinds. Either a simple fixed adapter or a pigtail. The fixed or rigid adapter is simply two different connectors mechanically and electrically linked together back to back. The result is a 1 to 2 inch piece of metal that is screwed to the connector on the radio and has the connector of the coax screwed to it. The rigid adapter tends to act as a lever applying stress to the radio whenever the radio or the coax moves.

A pigtail adapter is a short length of coax with different connectors at the two ends. One connector goes to the radio and the other connector screws together with the connector on the coax from the antenna. The purpose of the pigtail is to reduce the strain which the coax (and any adapter) would put on the connector at the radio. The purpose of a pigtail made of RG316 (or RG174) is that this coax is much more flexible than the coax coming from the antenna. In base station installations sometimes RG58 coax is used for a pigtail because it is thinner and more flexible than the much thicker coax usually used for base station antennas, but for use with an HT, you want a short length of VERY flexible coax, which is why RG316 or RG174 is preferred.

The best length for a pigtail depends on how it will be used. If it is used JUST as an adapter between the coax and the radio, then 6 to 9 inches is adequate. This is what I would expect from your description of your planned installation. On the other hand, if the operator is going to be picking up the radio to talk on it (not using a headset or speaker microphone) then a pigtail about 2-3 FEET long becomes appropriate because you would want a pigtail long enough so that moving the radio doesn't also drag the heavier coax going to the antenna.

Very good advice. Could not agree more. Especially take note of the stress put on coax connector solder points to a circuit board. I have seen many failures on different brands of radios because of stress . What breaks the solder points down the most is when a rigid metal adapter is put right at the radio with a female SO-239 on the other end. Then someone hooks a piece of 1/2 inch coax to the adapter and then moves the radio about a lot. It does not take long for the output connector in the radio to break loose from the PC board. Becaus e of this, I usually transition over from one type connection to another with a pigtail. A SMA connector is so small I would think you would especially protect it.

Just because an antenna comes with 15-20 feet of coax does not mean that you have to keep that coax between the antenna and the radio (note there are a few antenna designs that DO involve the coax as part of the antenna, but I can't think of any mobile antenna of that sort -- and certainly not the Larsen NMO2/70B mobile antenna you plan to use). If you are going to have the antenna mounted to the box and the radio in the

box, you probably only need about 1 foot of coax. The Larsen NMO2/70B does not include the required NMO mount (although some places sell the antenna and mount together as a package). Personally I would shorten the coax down to just what you need. If you aren't familiar with cutting and installing coax and connectors, any competent radio shop can certainly do it for you - as could most older hams.

The coax from the antenna will probably come with a PL-259 connector (some sellers may offer a choice of other connectors, or if you deal with a radio shop to shorten the coax they can install any connector you prefer).

The radio itself requires an SMA-F connector -- but even if you have a choice of connectors for the coax from the antenna, it is probably NOT a good idea to connect the coax directly to the radio (see why below)

The antenna connector on these radios is supported directly by its solder connection to the circuit board, not by any rigid mounting to the body of the radio - thus excessive strain and vibration would tend to break the connector loose from the circuit board

Normally the coax from any antenna will have a PL-259 or a BNC connector -- this requires some sort of adapter between the connector on the coax and the connector on the radio. Such adapters come in two general kinds. Either a simple fixed adapter or a pigtail. The fixed or rigid adapter is simply two different connectors mechanically and electrically linked together back to back. The result is a 1 to 2 inch piece of metal that is screwed to the connector on the radio and has the connector of the coax screwed to it. The rigid adapter tends to act as a lever applying stress to the radio whenever the radio or the coax moves.

A pigtail adapter is a short length of coax with different connectors at the two ends. One connector goes to the radio and the other connector screws together with the connector on the coax from the antenna. The purpose of the pigtail is to reduce the strain which the coax (and any adapter) would put on the connector at the radio. The purpose of a pigtail made of RG316 (or RG174) is that this coax is much more flexible than the coax coming from the antenna. In base station installations sometimes RG58 coax is used for a pigtail because it is thinner and more flexible than the much thicker coax usually used for base station antennas, but for use with an HT, you want a short length of VERY flexible coax, which is why RG316 or RG174 is preferred.

The best length for a pigtail depends on how it will be used. If it is used JUST as an adapter between the coax and the radio, then 6 to 9 inches is adequate. This is what I would expect from your description of your planned installation. On the other hand, if the operator is going to be picking up the radio to talk on it (not using a headset or speaker microphone) then a pigtail about 2-3 FEET long becomes appropriate because you would want a pigtail long enough so that moving the radio doesn't also drag the heavier coax going to the antenna.

Maybe they have a way of decoupling the coax from the antenna. That was the design of the original ground plane, two opposite horizontal wires (look up the patent) that prevents RF from going down the outside of the coax.

>
> You can change the length of an antenna to change the impedance which will affect your SWR. I'm sure that is what Larson is doing if they say you don't need a ground plane. (They are saying they are giving you a 50 ohm feed point.) You also don't need a ground plane for any vertical. However you may not be seeing a 50 ohm input impedance either. ALSO: You are not getting the best radiation efficiency out of the antenna either! SWR is only part of the story. Antenna efficiency is another part of the story. As for "gain", all I can say is the other half of the story is, "compared to what?" Maybe they are comparing it to a dummy load! When I install an antenna I am usually looking for performance and not just a low SWR. The bottom line is if you have a vertical fed at the base with no ground return you don't have the best efficiency and performance would be enhanced with a ground plane.
> Lee, w0vt
>
>
>
> Interesting. I'm a little bit familiar with the ground plane necessity. One reason I chose the Larsen is that it is, with the Baofeng's frequencies, functionally a non-ground plane antenna, which is why I chose it for the motorcycle.

I program UV5R's for about 25 different folks including 18 for my local police department. That's over a dozen different programs. Went without any issue til I tried CHIRP. Units would go to TX when I plugged the program cable in. Got that to stop. Then only certain radios would accept CHIRP. Used CHIRP for the personal ID for each unit. The original software started giving me problems and shortly both programs quit. Removed CHIRP, but still cannot get the original downloaded from Mikor to work. Can't upload from radio either. Cleared program on one and that did not help. Four different programming cables. Plugged in firmly. In original port. Tried in both home and office computers. Would even purchase a better software cable set if that would do it. Thanks in advance for your help.

You're using IE AND Nortons? Masochism or religious reasons?

Seriously, I'd consider using Firefox or Chrome rather than IE for anything not IE (ActiveX) specific (sadly some sites do require IE). Nortons as an AV solution isn't ideal, it's bloated and I've seen it miss things it should have found that the (freeware!) Microsoft Security Essentials jumped on at once. AdAware have just released a free Antivirus that seems pretty good – naturally there's a pay me version that has more features but if you want a fully commercial solution I strongly recommend Kaspersky or F-Prot. I spend half my life de virusing computers for people.

FYI Useful tools –

Malwarebytes Antimalware (Picks up a range of adware/malware that won't necessarily show up in your AV app)

ADWCleaner (somewhat more aggressive and detailed cleanup of oddball adware/malware)

RogueKiller (Very thorough, but you need to watch it doesn't remove some wanted registry settings)

TDSSKiller (A Kaspersky product – A root kit finder/killer)

All are freeware (Malwarebytes has a "Pro" version with a 'live' monitoring process – worth it IMO)

If you need a free AV app, Microsoft Security Essentials is ok (but not supported on XP anymore) Adaware and AVG both have free versions, which are not bad at all – though the AVG version particularly tends to 'nag' you to register the paid version and trys to sell you other apps (Performance stuff).

I prefer F-Prot myself which has a 30 day trial version but no free version, but if you have nothing at all or your paid product has 'expired' they all make excellent stopgaps while you shop for something more permanent. I used MS Security Essentials on most of my stuff til quite recently, and found it adequate but not excellent – however the other free products I mentioned do 100% cleanup of any virus I've yet encountered in the wild. (YMMV of course there's new stuff out all the time). Beware of Cryptolocker and it's variants, the virus itself is quite easy to find and remove but the encryption it imposes is essentially irremovable without the key the crims have so the only real protection for your documents (it encrypts word/excel/access etc documents, photos, videos etc – stuff you DON'T want to lose particularly if it's a business computer with vital records etc) is a backup – note that it will also encrypt documents on a server you have write access to, so you need your backup offline – an external HD or Cloud site or similar. A 'snapshot' of your drive(s) with (say) the Freeware version of Macrium Reflect is an excellent solution for backup and recovery from both virus and hardware issues.

I keep my BaoFeng UV5R config files on a machine that most of the apps listed above to keep it protected. (And you thought this was going to be totally off topic didn’t you ;^)

Sounds exactly like what happens if you have a Chinese fake programming cable with drivers that worked, but a Windows update (if you are on windows) loads the newer drivers corrupting the fake cable's functions. If this is the case it is not your programming software at fault. Consider that you said BOTH softwares started exhibiting problems at the same time. What is the common denominator? The cable and drivers. Just an educated guess from having had the exact same experience.

The link Mike gave referring to older drivers can fix it, but you still have the possibility of drivers getting updated again or disabling updates which effects all drivers on the computer. If this is your problem, I can guarantee it is better to get a "Genuine FTDI Cable" ($20 - $25) if you don't have one.

Just my $0.02 worth...

What version of CHIRP? Should always use the latest daily snapshot.
What firmware versions? I doubt they are all the same…so perhaps you bricked some radios by cross loading incorrect firmware images?
Have you tried doing a recovery from erratic behavior?
http://www.miklor.com/uv5r/UV5R-Recovery.php http://www.miklor.com/uv5r/UV5R-Recovery.php
Have you tried using the older driver? http://www.miklor.com/COM/UV_Drivers.php http://www.miklor.com/COM/UV_Drivers.php

If both programs quit and you have the problem on two different computers I'm betting you hosed the firmware….

Subject: [baofeng_uv5r] Cannot program

I program UV5R's for about 25 different folks including 18 for my local police department. That's over a dozen different programs. Went without any issue til I tried CHIRP. Units would go to TX when I plugged the program cable in. Got that to stop. Then only certain radios would accept CHIRP. Used CHIRP for the personal ID for each unit. The original software started giving me problems and shortly both programs quit. Removed CHIRP, but still cannot get the original downloaded from Mikor to work. Can't upload from radio either. Cleared program on one and that did not help. Four different programming cables. Plugged in firmly. In original port. Tried in both home and office computers. Would even purchase a better software cable set if that would do it. Thanks in advance for your help.

Interesting. I use the free version of Malwarebytes as an occasional double-check for Symantec, I have only contacted Malwarebytes support once, but I got far better support from them than what you describe. They did direct me to some tools on third-party websites but all were free and although the process was lengthy I got step by step assistance via email throughout the process - all for free and without even a pitch for their paid version.

As for malware malbites paid version, they handed me over to a third party site that took over my computer and searchedout all the bugs that malware let me get infected with and they wanted $149.00 for a one time fix, $249 for a fix and 1yr proction. and $100 a yyear progressively. a hard drive was $49. malwarebite didn't even offer to try to remove any of it. I stopped the autopayment for the noncoverage

The dummies at Norton's came out with a patch 3 hours later to fix it. I use Malwarebytes too. Luckily I have multi-browsers so switching to another after seeing it was a faulty update from Event Viewer info with IE and a Norton's DLL. I switched to Safari on one puter and Firefox on the other.

Subject: RE: [Bulk] Re: [baofeng_uv5r] Re: Decent cheap antennas and SWR meters

You're using IE AND Nortons? Masochism or religious reasons?

Seriously, I'd consider using Firefox or Chrome rather than IE for anything not IE (ActiveX) specific (sadly some sites do require IE). Nortons as an AV solution isn't ideal, it's bloated and I've seen it miss things it should have found that the (freeware!) Microsoft Security Essentials jumped on at once. AdAware have just released a free Antivirus that seems pretty good - naturally there's a pay me version that has more features but if you want a fully commercial solution I strongly recommend Kaspersky or F-Prot. I spend half my life de virusing computers for people.

FYI Useful tools -

Malwarebytes Antimalware (Picks up a range of adware/malware that won't necessarily show up in your AV app)

ADWCleaner (somewhat more aggressive and detailed cleanup of oddball adware/malware)

RogueKiller (Very thorough, but you need to watch it doesn't remove some wanted registry settings)

TDSSKiller (A Kaspersky product - A root kit finder/killer)

All are freeware (Malwarebytes has a "Pro" version with a 'live' monitoring process - worth it IMO)

If you need a free AV app, Microsoft Security Essentials is ok (but not supported on XP anymore) Adaware and AVG both have free versions, which are not bad at all - though the AVG version particularly tends to 'nag' you to register the paid version and trys to sell you other apps (Performance stuff).

I prefer F-Prot myself which has a 30 day trial version but no free version, but if you have nothing at all or your paid product has 'expired' they all make excellent stopgaps while you shop for something more permanent. I used MS Security Essentials on most of my stuff til quite recently, and found it adequate but not excellent - however the other free products I mentioned do 100% cleanup of any virus I've yet encountered in the wild. (YMMV of course there's new stuff out all the time). Beware of Cryptolocker and it's variants, the virus itself is quite easy to find and remove but the encryption it imposes is essentially irremovable without the key the crims have so the only real protection for your documents (it encrypts word/excel/access etc documents, photos, videos etc - stuff you DON'T want to lose particularly if it's a business computer with vital records etc) is a backup - note that it will also encrypt documents on a server you have write access to, so you need your backup offline - an external HD or Cloud site or similar. A 'snapshot' of your drive(s) with (say) the Freeware version of Macrium Reflect is an excellent solution for backup and recovery from both virus and hardware issues.

I keep my BaoFeng UV5R config files on a machine that most of the apps listed above to keep it protected. (And you thought this was going to be totally off topic didn't you ;^)

I've got 2 Tram 1185's and they both work great inside the house and on the car. From South Lansing, MI I hit a repeater well in Lowell about 55 miles away. That is with either of my Buttfang UV-82's. <https://col126.mail.live.com/Handlers/ImageProxy.mvc?bicild=&canary=YKv7HsB3B%2fDENHoAKBBae%2fs4G7RUqcLDl5XFoErIv2U%3d0&url=http%3a%2f%2fgeo.yahoo.com%2fserv%3fs%3d97359714%2fgrpId%3d83108440%2fgrpspId%3d1705063108%2fmsgId%3d48733%2fstime%3d1424476359> http://www.amazon.com/Tram-1185-Amateur-Dual-Band-Antenna/dp/B0045EQUBK My SWR on them is 1.25 or so on my car. Not bad for no adjusting done.

Indoor I do set them on a large round pizza pan :)

My new awesome Chinese Soy Sauce SWR meter is this: http://www.amazon.com/Redot-1050a-Digital-Meter-Mobile/dp/B00MTFKL1C They are very cool and seem very accurate. They are heavy chunky steel. We built these in a club program a while ago. Works VHF and UHF and costs very little.

A tape measure yagi…folds up too which makes it more portable. Help to have an antenna analyzer to optimize the hairpin match but it's not crucial. Most of us matched at first hookup.

I think Ten-Tec did that a while back and sales weren't so hot for those QRP hf models. One Chinese outfit is currently marketing the Xiegu X1M Pro QRP hf rig, another one the HF One MKII. For my money, however, I'd rather look at a nice used Kenwood TS-140 in the same price range as these two Chinese HF rigs.

You can cut a piece of 2x4 into a 2x2 for boom/handle and use old tv antennas or brazing rods for elements. the how to is all over youtube

ok thanks, I think I will order me a radio and get it programed. I will probably be getting back for help with that. I see it done on U-TUBE. I have read that the uv5r is the best way to go. I think I had on of these radios several years ago and didn't have much luck with it. I see they are more popular now and maybe it will go better for me. Thanks Frank/Wd8pmb

Hi All,

OK I must agree with Stan the name choices are kinda strange. But I like the TERMN-8R. I like the true dual receive capability, cross-band repeater will only work for me in the case where you can boost power, for example from a HT in a valley through a near by mobile 50w in a car up on the ridge to a repeater in town 35 miles away. The GMRS/MURS is OK but not that hot.

The upgradable firmware seems a good idea but the implementation of having to send the radio in, and wait for it to be serviced and returned is not the ideal situation. My thoughts would be something through the programming software like RT Systems or Chirp, that the software can go check if there is a firmware update, and if there is one, ask the user what to do, and if the user chooses to update right there and then, it will remove any user interactions until the unit is up and running even though it has to be reset yo factory settings then the software can reload the memories and other customization in a step 2. Specially when you have 200 memory to set back they way you wanted it in the first place. OK maybe I can spend an afternoon reprogramming my radio but when you have 200 radios you need the software for sure.

The case looks nice, I wonder what the 2nd knob will do, possibly set squelch levels, or scroll through the memory bank. The water protection should please some of the members who posted here asking for it, it's OK with me. I like that the zero button is now more like the other radios. I guess now we can save our UV-5Rs as collector's items ;-)

For the receiver range I like it to. I was hoping for a 2m/70cm/220 HT but having receive capabilities for aircraft bands can be handy. The AM/FM range us also cool. The NOAA is sure nice to have on a long deployment. I am not sure how the monitoring for NOAA alerts will work, if they mean it will switch to the preset NOAA station when an alert is issued then that would be awesome for sure.

The Group and a Single Calling support is also a feature I would use in my work. The custom CTCSS can be a very important feature when setting up Command vs. Staff communication plans. Law Enforcement and Emergency Medical Services has its peculiar needs at times, so the frequency hopping FHSS might set this radio apart from the rest of the gang. The scanning mode looks promising and usable.

The 6 watts oh well! I wished for a bit more but if 6 watts is stable then I'll take it.

So what is to remain to ask is:

1) What kind of price structure will the TERMN-8R have, and
2) How much of compatibility with the UV-5R accessories will it have. I can see the battery might be the same, but if the external mic, or ear plug will be interchange then it's OK.

But all in all I am looking forward to working with this new radio and put it through the paces.

The hyped it so much to try to get everybody on edge to buy something new you can bet the price will be 3 if not 4 times higher than any Baofeng. they are shooting for the bragging crowd that always says "My radio cost more than yours" and "My toys are better than yours". that mentality is what keeps thee big names prices so high. Baofeng has proved the profit margin the big names are getting is way over inflated. and as long as those with that mentality are out there good radios will be out of the majority of hams reach.

Subject: Re: [baofeng_uv5r] Re: The big announcement !!!!!

Since this radio has been closely copied from an existing Anytone unit, if you need (want) 2m/220/440 capability, Anytone already makes a tri-band radio that fits that bill nicely (with aircraft receive and FHSS as well). Check out this link if you want to know more: http://www.importcommunications.com/

As to the accessories, I doubt the batteries from any existing Baofeng radio will fit, as the case design looks too different to me (but I wouldn't mind being wrong on that issue either). If the new Anytone Tech radio's FHSS works the same way as the existing Anytone tri-band handheld, I'm not so sure that you'll find it that appealing, but since each user's needs are different, perhaps it will work for you.

In any case, I think most Baofeng user's will fall over when the see the probable pricing on these new units. They will be no where near the <$60 price point most have long been accustomed to, the high end unit will probably be three times that amount (again, I would not mind being wrong on that either, but it does seem surprising that Baofeng Tech has yet to release any pricing on these units so far - after all the hype).

Wow James! Funny you should mention the "My radio is better then yours" aspect. I was monitoring the local repeater last night and had a guy bragging about his Yaesu and TYT stuff when he found out the other guy was using an anytone mobile and had a 5r as a handheld. I vacillated jumping in to the fray, but decided not to.

48781. squelch tail elimination

Yahoo group: baofeng_uv5r (2015)
Date: 2015-02-24 17:47:50 UTC
From: pcole0157@...
Topic: 48781 Message: 48781

Does anyone know if the radio can be set through "chirp" to eliminate
the squelch tail the way a commercial radio works.
When most repeaters drop they dampen the squelch in the handheld
so you don't hear any at all.
I've tried different settings with no luck. The tail on these things is ear splitting.

Topic: 48781 Message: 48784

It depends on whether you are using PL or DCS.

On DCS it uses the industry standard 134.4 Hz turnoff code. Setting Menu 35 ON enables the turnoff code to be transmitted when a transmit DCS code is set in Menu 12. The receiver mutes on the 134.4 Hz tone when a receive DCS code is set in Menu 10.

On PL you are SOL. Baofeng does NOT use industry standard reverse burst squelch tail elimination, even though the hardware is capable of it. Instead they use a 55 Hz STE tone. This is only compatible with Baofeng, Wouxun and maybe other Chinese radios. Menu 35 also enables this. When a transmit PL tone is set in Menu 13 then the tone changes to 55 Hz briefly when you unkey. The receiver mutes on a 55Hz tone if a receive tone is set in Menu 11 or even if it is receiving carrier squelch (no tone).

The only other thing to do is set up your repeater so that it stops transmitting the PL tone after the receive signal stops and transmits no tone on the hang time for at least 2 seconds.

When the Baofeng receiver looses the PL or DCS code the squelch stays open for about 2 seconds.

Thanks Tom....I suspected something like that. Just about all repeaters do the reverse burst. It worked well in the early days of reed decoders to dampen them.
This little radio works fine but if you have the volume up at all the tail on it is brutal. When they learn to write a proper manual maybe they'll fix that too.

Pete....

"I wonder if the Yaesu FT 60 would be a better buy"

Depends on budget, but if you plan to spend around $150 for a Yaesu FT-60R, I'd also recommend taking a hard look at the Wouxun KG-UV8D handheld, as it has several features that the FT-60R does not (in fairness, the FT-60R was first announced at Dayton 2004, so it is showing some signs of age).

"Baofeng has proved the profit margin the big names are getting is way over inflated."

I disagree. I think Baofeng has proven something more along the lines of "You get what you pay for". But I WILL say that, in the case of my UV-5R, I DID get a little more than I paid for. But it's nowhere the equal of the big names. For that $30, you don't get a distribution network or tech support. This group is the tech support. The only Baofeng presence in this country is a PO box somewhere. I also suspect that very little engineering went into these radios. I'm an engineer, and engineering time is not cheap. The components on this radio look to be worth more than $30. If I had to guess, I'd say that Baofeng's design was pilfered from some other company*, and built in a sweat shop somewhere in China.

* Or they hired a design engineer from a competitor, and had him replicate a design he did elsewhere.

However, the "built in a sweat shop somewhere in China" thing is probably the same with even the big names, so I won't fault Baofeng there.

I live in a marginal reception area. I'm in a bit of a hole, with a ridge between me and the main peak where most of the repeaters are. So most of my ham'ing is mobile.

For mobile use, my 5R is very marginal. If I'm going over 40mph, the swaying of my antenna causes "picket fencing". I suspect a marginal AGC circuit. I can go to a shorter, stiffer antenna, but then I don't know if I'll be able to pull in the local repeaters. It's iffy now with a 5/8ths whip. I'm not unhappy with what I got for $30, but I have no delusion that it's equal to an Alinco, Kenwood, or Yaesu. My 20+ yr old BC200XLT scanner works MUCH better for mobile reception with the local repeaters. With my scanner, if the squelch breaks, it keeps the signal until the repeater stops tx'ing. Not so with my 5R, using the same antenna. And I'm not an equipment snob. I was sincerely hoping that I'd be able to, with my little $30 radio, do everything I could do with a $200 radio. I would prefer to be able to brag that my cheap equipment can do everything that someone else's high $$ rig can do, but that's just not the case. On the bench, the 5R looks pretty good. Compared to my scanner, the sensitivity is about the same. But that's with a single tone input, with no interference. In the real world, my scanner's front end works much better.

I'm going to keep my 5R, but I will likely get something better soon. The 5R makes a decent backup. I could see how, for some people, this radio would work as well as anything. But for me, it has some shortcomings.

Dave the announcement was a new line of Anytone manufactured radios that will be sold by a company - better known for Baofeng sales (Baofeng Tech).

But most interesting to me was the upgradeable firmware (done by the US company - I'd rather pay whatever it is to upgrade than to re-buy a whole new radio) - there is no Chinese radio that I know of that has that the ability to upgrade its firmware...

It also had more Japanese / US inspired features like: the NOAA radio, and actual Aviation bands (a previous anytone only went to 118mhz)

Finally and I am assuming this was their main sales point (doesn't mean that much to me) - It will be the first Ham/Commercial radio to be legal and include a MURS/GMRS mode... (No radio has ever done that and it was a very smart move to do)

There are Anytones in the US already - but I am going to hold out for the pricing on these myself:

Before you guys say that Baofeng's offices don't exist, I just wanted to say that I sent a radio directly to their office for RMA and received a replacement. Their physical location exists, and it isn't a PO box, it's a house: 45651 207th st
Arlington, SD 57212

This is the address on streetview:
https://www.google.com/maps/place/45651+207th+St,+Arlington,+SD+57212/@44.383773,-97.07744,3a,75y,25.38h,81.24t/data=!3m4!1e1!3m2!1sl08awA5SZZ-ZYooTySPqeQ!2e0!4m2!3m1!1s0x8789b33946ac4db7:0x4b9835109d0c14f0 https://www.google.com/maps/place/45651+207th+St,+Arlington,+SD+57212/@44.383773,-97.07744,3a,75y,25.38h,81.24t/data=!3m4!1e1!3m2!1sl08awA5SZZ-ZYooTySPqeQ!2e0!4m2!3m1!1s0x8789b33946ac4db7:0x4b9835109d0c14f0

I've been in email contact with them and they seem like very nice people. I'm sure you could walk up to the door and say hi if you really felt like it.

I downloaded the owner's manual for the TERMN-8R and the OBLTR-8R and was reading through it. I was pleasantly surprised by the very last page of the manual. It is Anyone's Tech Letter to You. My faith in mankind and even some of the business world is pleasantly restored. The last company I openly saw promote this was the Hodgdon Powder Company, and they promoted this in their company mission statement.

I'm trying to use the radio as a echolink node. But I can't seem to get the cable right. Then i put the cable in the radio it keys up.

I have even bout a 2.5 to 3.5 adapter cable and used a 3.5 to 3.5 but when i plug it into the usb sound card it keys up.

Does any one have a wiring diagram for this?

I have a Wouxun KG-UV8D... It's a nice to look at sort of radio but it has several annoyances. I don't like mine after owning it for about 7 months now. I bought a couple of UV-5R's and now the KG-UV8D sits on the desk. The UV-5R is a heck of a lot better "to use" and doesn't suffer anywhere as near the amount of problems the UV8D does. Like the Wouxun KG-UV950P quad band mobile I have, it is plagued with poor design, poor controlling software, poor noise rejection (it's especially poor at this), and for a hand held, it chews through battery power. You name it, the UV8D suffers from it. It is loaded with good features on paper and at first sight it seems to promise all but delivers very little.. It IS however, well made compared to the UV-5R, but that means nothing in the real world if you can't use it.

I am going to buy a Yaesu FT-60 in due course. The UV-5R is a great to use, but an averagely made radio so I am going to replace all of my Chinese made jobs with something more expensive but much better made and much better to use...

I would NOT recommend the KG-UV8D for a serious amateur radio guy/gal at all... Unless you are a very accepting or not a very 'fussy about things' kind of person, the UV8D will disappoint...

"I wonder if the Yaesu FT 60 would be a better buy"

Depends on budget, but if you plan to spend around $150 for a Yaesu FT-60R, I'd also recommend taking a hard look at the Wouxun KG-UV8D handheld, as it has several features that the FT-60R does not (in fairness, the FT-60R was first announced at Dayton 2004, so it is showing some signs of age).

Well, that's another great part of the hobby, everybody can like (or dislike) different products.

I've owned both units (having just sold off the last FT-60R a few weeks ago), so let me explain some of the differences (that may or may not mean anything to you).

The Yaesu FT-60R shows only one band (or frequency) at a time (vs. 2 on the UV-8D), the FT-60R can't have alpha-numeric naming beyond 6 characters (vs. 8 characters on the UV-8D, which is handy when trying to scroll through 1,000 memories), the FT-60R ships with a tiny 1400 mAh older technology NiMH battery (vs. either a 1800 or 2600 mAh newer Li-Ion battery on the UV-8D), the FT-60R can't go out of band without a hardware modification (vs. the UV-8D's ability to do this out of the box), the FT-60R doesn't support Narrow Band at all (vs. being a standard feature in the UV-8D), the FT-60R's smallest step size is 5 KHz (vs. 2.5 KHz on the UV-8D), and the FT-60R is simply too old to offer a cross-band repeat function (vs. being a standard feature on the UV-8D). Since the FT-60R was designed to be ham only, it doesn't have FCC Part 90 acceptance either (but the UV-8D does).

I can only comment about the radios that I have personally owned, so your experiences may very well be different. I live in a relatively hot rf area, and have had various radios sitting on my desk during most business days. The early Baofeng's I owned must have been Chinese for "barn-door" (as they let everything though), but they have gotten better over time. The FT-60R is certainly not a "bad" radio by any stretch, but it certainly lacks many of the "nice to have" features from an end-user's perspective - but considering it's a 10 year old plus design, it's certainly been a big hit for Yaesu in years past.

I normally get the UV-8D units with the largest battery I can (2600 mAh), which brings the cost of the radio to around $140-$150 US. With that battery configuration, and the color display set to be on constantly with no timeout, the radio easily lasts me almost two days on a single charge. Of course, you could extend that by turning off the color display (another difference vs. the Yaesu), but I like being able to see what signal is active so I leave the display set to on.

I have used one of the KG-UV950P for quite a while now. I really haven't had any issues with it. The programming software (not unlike all the Chinese vendors) leaves something to be desired, and there is yet to be support for it in Chirp that I have found. However, it is useable.

I have programmed several of these radios for folks in the local club, and so far haven't heard of any serious problems.

I have used it extensively on 2/70/6 and a few times on 10. At the moment, it's the main 2/70 rig in my shack, although I also work a few 6M repeaters from it as well (also use the FTDX-1200 for 6 and 10 FM and don't notice much differnece).

I also have the FT857D and I will say that is a far superior radio, but it is also a LOT more expensive.

Feel free to contact me off-list if you have any specific questions about either rig.

I noticed the active front end mixer approach; it says it works well with most radios but not the software driven UV5....

How about this: anyone know if the old UV3 had an s meter? I have not had time to play with my old one much yet, but it appears it may have a working s meter?

48842. 8 Watt Radio

Yahoo group: baofeng_uv5r (2015)
Date: 2015-02-27 04:38:26 UTC
From: L L bahr
Topic: 48842 Message: 48842

For what it's worth, I've been thinking about this new 8 watt radio. I think it's been mentioned before, WHY? From 5 to 8 watts you don't even get 3 dB gain and the extra power is a real drain on the battery. Being as small as it is, I'd rather have longer battery life. With 8 watts I would think you would almost need the 2800 mA battery on the thing. This radio sure would not do much more when getting into a repeater compared to a UV-5R. For line of sight maybe a tad more range for almost twice the current drain. (Sometimes more is not better.) I've purchased three of these UV-5R and find them intriguing for the money. An 8 watt model leaves me cold.

Hi Lee

I guess you are referring to the Baofeng BF-F8HP model.

As you used the word "intriguing" I can tell you that because of that word I own 2 UV-5Rs and 2 BF-F8HPs. I also found it intriguing.

I do operate all my radios with the 3800 mAh battery and the Nagoya N-771 antenna. I also have the A-V85 antenna. The radios perform well with these setups and the extra 3 watts do make it easier to communicate while in tough locations such as valleys and ravines. I like these radios because one of my Yaesu FT-60r fell out of its pouch and I could not retrieve it.

So, for the price they do have an appeal. I hate to lose any of them
now.

Hello All

Where did this name come from? I saw the support Miklor section, but I could not find the About or Contact sections. Also I could not find a link to the Yahoo Group. I am under the impression that these two complement each other.

Thanks for the info.

Hi lee,
A ham on ebay sells a slim Jim.
Supposed to be better then the J pole made from 450 ladder line.
Just thought I would mention it because many hams use the HT from home.
I hang it near the window here on the 4th floor and bring up repeaters 20
to 25 miles away.
I ave to agree that in low areas your going to need more power.
I did look at the HD battery but asking myself how long it would last with
8 watts and how hot will that HT get running 8 watts?

As others have mentioned already, going from 5W to 8W (on VHF only, UHF jumps to 6W) only bumps the signal being received a very small amount.

"Most" of the folks that compare the non-FCC Part 90 certified BF-F8HP 8W radio use the better antenna that it ships with and compare it to the crappy antenna that their UV-5R normally has, and voila, they see a difference (which they immediately believe is due to the additional wattage). When you ask them to swap the antennas and repeat their tests they tend to get quiet about the extra 3 watts making any real difference.

For those that want an 8W Baofeng radio that's FCC Part 90 approved, consider the BF-F9 V2+. Unfortunately it normally ships with the crappy antenna, but with the money you'll save (vs. the BF-F8HP unit), you have more than enough to get a better antenna, plus you'll have an 8W radio that's FCC Part 90 approved (not that it means much to some folks).

It should be a fun IWCE show next month, as I've heard several folks are planning to introduce new products, including a

(wait for it!) ....

10 watt handheld!

I'd make a joke about it burning paint off or having to use a glove to prevent severe RF burns from the extra power, but unfortunately some would believe it.

There are a few videos on you tube comparing them, If you get what you pay for stands true it should be a good little HT but its four times the price of a UV-5R. A replacement battery cost more than a UV-5R.

Power out, sensitivity, selectivity are similar to the UV-5R. Howver the KG-UV8D, In my opinion, is a bit more user friendly: bigger display, color, working S-meter, single or dual channel display (user selectable) ablility to display AND edit programmed channel parameters (e.g. PL tone) from the keypad, selector knob, feels solid, good battery life. 999 Memory channels

Factory software is a little clunky, CHIRP is almost there, but not quite, so you might have to use both until CHIRP is fully developed.

You could get 3 or 4 UV-5R's for the same price. Are the differnce worth it? You have to decide that.

This is MY opinion.....

FCC Part 90 means nothing if the radio cannot be locked down as required: (Keypad lockout and amateur mode lockout) (§90.20 (g))
(1) Is such that transmitters with external controls normally available to the operator must be internally modified to place the equipment in the programmable mode. Further, while in the programmable mode, the equipment shall not be capable of transmitting. The procedures for making the modification and altering the frequency program shall not be made available with the operating information normally supplied to the end user of the equipment; or
(2) Requires the tramsitter to be programmed for frequencies through controls normally inaccessible to the operator; or
(3) Requires equipment to be programmed for frequencies through use of external devices or specifically programmed modules made available only to service/maintenance personnel; or
(4) Requires equipment to be programmed through cloning (copying a program directly from another transmitter) using devices and procedures made available only to service/maintenance personnel.

Currently the only Baofeng to do this is the: UV-82C

Since the UV-5R radios (and many clones and generations) cannot do this - Part 90 (with a sticker or not) will never matter until they can do it.

I have an '8D, 5R's, and a KGUV6D. And a UV-3R plus, whose receiver is worse than the 5R's....!

The 5Rs seem a little more sensitive than my 8D, although both are software defined radios. As others have said, the 8D is four times the price.

For the price, I think the 5Rs are great, (poor receiver), the 8D is expensive for what it is, but the 6D is a completely different radio, in that not only does it appear to have a conventional receiver, but the front end of the radio is track tuned by four varactor diodes which makes it anything but a "barn door". I have not seen a schematic for the 8D, so whether it is a "barn door", or tuned like the 6D, I don't know. I do know it does not seem to suffer over much from strong signals on nearby channels.

I was working a mobile station with my 6D, when I was also mobile, 50 yards in front. We were working through a 2 meter repeater some 8 miles away over the brow of a hill. The other station was running 25 watts, using LMR (PMR) equipment.

I was a passenger, and was using the 6D with its normal antenna, and no ill effects receiving 600 kHz up from the transmitter of the guy behind. He had a fairly large mobile whip. The experiment was a success, and dissuaded me from selling the 6D, which I now use at hamfests, with no ill effects, unlike those folks struggling with the 5Rs.

The love affair with the 5Rs continues, however :-) The best radio I ever had, because it was so cheap that I could afford to write it off, so I take it everywhere with no concern, and get a lot of use from it as a result.

YMMV,

73 de Stan, G4EGH

In my opinion, the UV-5R is a lot simpler, not as well made/assembled, and has nowhere near as many features compared to the Wouxun KG-UV8D, but it's a better radio to "use", far better than the KG-UV8D... It does ONE thing that the UV8D could not. It handles noise reasonably well... When you've sampled the poor noise handling that my UV8D yielded, you'd understand why I use only the UV-5R, given the choice...

The noise handling capabilities between the two radios alone for me, is more than enough to sway me the Baofeng way. The Wouxun KG-UV8D simply fails, just like the KG-UV950P I also have does, which has almost indentical noise handling capabilities - Very Poor...!!! - in my humble opinion...

I just haven't experienced anything near as bad from the Baofeng UV-5R and that puts a big smile on my dial. I'm not overly in love with the UV-5R's lesser build quality, but it is a far better radio to take with you, come walkabout time,, once again,, in my opinion...

My particular KG-UV8D was bought new, approx Aug/Sept 2014, straight from the factory in China, and had the very latest firmware v1.05 at the time... The two Baofeng UV-5R's were also bought new, about 2 months later,, after I had "had enough" and could "take no more"...

"Commercial Slim Jims" such as the one you mention are not all that flat either (50 ohms across our band). Although the RF energy is directed more out to the sides creating gain. They are however easy to make out of practically anything that has 2 parallel conductors. They also tend to be very sensitive to nearby objects placed close to them.

For those who can remember using the Motorola MX 360 radio with the metal speaker grill. While the radio only put out 5 watts or so, one could get semi-serious RF burns off of the grill when transmitting due to a rather poor RF ground (your hand or lips) and a rather poor antenna match.

Heh heh.

I have my old S HT's and 2 Alinco HT and three newer Alinco HT's.
My question is why the need for all the programing for the new HTs?
I see that the baofeng must be the biggest list but I do mine manually.
Also the older HT's about 5 to 7 years have the off set automatically
changes when I hit 147.000.
I like the tiny UV 5R V2+ and have another one in abut a week.
Just looking for a valid answer when I can do it with no cord or chirp.

have you attempted to put in a channel and skip it when scanning ?

have you attempted to add a text name to a saved channel?

I think that you will quickly understand why SW is a good way to program if either of those options are a priority for you.

Hi Marc,
No I really do not have the need to scan.
I plug in my repeaters and just use the HT.
If i'm out in the woods and want the weather then I just plug that into
the VFO mode.
Thanks for responding

In all of your radio examples above, you are describing radios that were purposely designed, manufactured and sold as radios to be used for the Amateur Radio service. The Baofeng are not designed, manufactured and sold for this purpose. But because of their low cost and the fact that they happen to cover 2 ham bands, they are popular for use in the Amateur Radio Service.

In the non-amateur services, the difference in frequency between a repeater's output frequency and it's input frequency are not standardized. It would be impossible to design a commercial radio that automatically selected the offset direction and amount.

Also storing the RX frequency, the shift direction and the offset amount would be wasting memory. That is 3 things that would need to be stored. Storing the RX frequency and TX frequency gets the job done with only storing 2 things. And those two thing also allow the programming of cross-band channels where RX frequency and offset do not.

Nobody can force anyone to program a radio with CHIRP. But without using any software, you can't do any of the following (and more)
- Find out the "real" firmware version (requires CHIRP)
- Program 7-character channel names with maximum character set allowed by radio (requires CHIRP)
- Edit the power-on message
- Lockout a channel from scanning
- Program RX only channels (TX disabled)
- Adjust the band limits (limit the VFO range)
- Disable the VFOs
- Disable FM radio

- Adjustable squelch thresholds to make squelch useable instead of ON/OFF (requires CHIRP)
- edit multiple memories at once (requires CHIRP)
- copy and paste between channels, tabs, radio models, radio brands
- RepeaterBook import
- RadioReference import (requires paid RadioReference account)
- Program PTT-IDs and/or ANIs

Hi Jim,
PK I just wanted some input.
I jut program what repeaters I use and really ave no use for scanning and the other things you listed.
The UV VR5 V2+ is a neat tiny HT that I can carry around and getting the weather frequencies is nice.
I'd like to see them come out with a single band.
Thanks for responding

You can program them manually but if you want features that are available only via software, then you will have to do without those features. Try putting a name in place of a freq, etc. Nice but not necessary.

Good chance that the problems have all been solder joints that were either not soldered at all or cold solder joints. If you are receiving free chargers as warranty replacements and don't mind the wait each time, just keep on doing what you are doing. Otherwise, open the base and check the connections. Or just go to 409 Shop to order the TYT charger which is interchangeable but far better constructed.

Hi donmor,
Thanks for your concern.
But the CD I received will not work.
I was then directed to Chirp but the person told me to keep trying then until I found one that worked.
I hate computers and when I have problems with them I just trash it.
Any way I talked to some guys on a local repeater using my old Alinco and it was nice with the SPKR / MIC.
As for programing the HT,I don't think I would ever have the need for all the features.
It took some time but I did find my way around the FT 8GR and I did work the ISS twice.
Also Amazon does not wait to grab my money LOL and my firm ware is the older one and their site says it's a 2014 model.
I will keep the one I have now but comparing it to my other HT's it sounds raspy but then I guess due to the small speaker.
I have repeaters in there now but my QTH is dead of VHF and UHF so there are some truckers that know I monitor 1 repeater wit the antenna 1,000 feet up.

The bad part is I can't even have a 1/4 wave GP out the window.
So much for PRB-1 :-)
For repeaters 20+ miles away I use the Slim Jim dual band and it works better then any home brew antenna I ever used.
I have no connection with this ham other then being very pleased with his work and during Super Storm Sandy I had one in use for 3 days.

The TYT BCG-F8 charger. It fits the battery/radio better then the Baofeng charger. I also runs off of 13.8 volts so it can be used in the car with a straight through cable. I've had mine since the middle of 2012 and it is all I use to charge my Baofeng BL-5 type batteries. I purchased mine from 409shop. The are currently $12.50 shipped to the U.S.A.

From: cprendon@...
Topic: 48872 Message: 48886

There are a couple known situations with some Baofeng Chargers which you may be experiencing: 1) you cannot interpret the charge state light if no radio is in the charger. You have to load the radio into the charger before plugging in the charger so that there is a load on it and the voltage is not floating to get a valid light status and 2) some of the chargers have a pair of contacts where the charger base contacts meet the PCB which sometimes have an invisible film that prevents proper contact. A light burnishing of the contact patches on the pcb takes care of the problem.

Not sure if either of these is what you are describing, but they are common problems with these chargers.

---In baofeng_uv5r@yahoogroups.com, <deadgoose@...> wrote :

I am now on charger base #3 (counting one shipped as #1) for my UV-5R. What is going on here? The most recent failure was that the charge light came on as red, with no charging. I assume it is the regulator chip going TU.

Any fixes?

Anybody have the same problem?

Wow! That looks EXACTLY like the Baofeng charger. Makes one wonder if there is a common manufacturer of at least the chargers, if not the radios.

And which TYT charger works with a UV-5R? (Could not tell looking at site.)
Lee

Good chance that the problems have all been solder joints that were either not soldered at all or cold solder joints. If you are receiving free chargers as warranty replacements and don't mind the wait each time, just keep on doing what you are doing. Otherwise, open the base and check the connections. Or just go to 409 Shop to order the TYT charger which is interchangeable but far better constructed.

Basically if you are doing just fine without software and don't have a desire for any of the features that require software, then you have answered your questions. Software has a lot of advantages for people that want the features it provides and the flexibility of changing your programming very quickly with other saved profiles. If you don't want any of this, then you are done.

Enjoy

People like to knock ordering items from Amazon. Figure to tell this story.

I ordering some electronics, it came from CA, I like in New York. On the tracking info, they said this...

Completed customs clearance process

Which joke should I go with??

a) I didn’t know California separated from the rest of the United States?

or

b) Those nuclear detonators were army surplus.

:)

Hey Bruce

Usually Amazon states the seller with website and location. It also has the rating of the seller based on customer feedback.

But again buying online = Globalization in action.

My 2 cents.

"I didn’t know California separated from the rest of the United States"

The Peoples Republic of Kalifornia left the United States a long time ago, but we've still attached with a physical boundary (at least until the San Andreas finally detaches the most radical comrades and sends them heading north toward Alaska).

From: beargyrils@...
Topic: 48900 Message: 48900

As usual they took my money out then told me the seller canceled my order.
I was the one who canceled the order because I checked and they had 2 more
coming my way.
My funds are still pending but they put the work load on me to take the
money out of pending status and put it back in MY account.
Amazon people lie a lot.'Now they say the seller ad none in stock.

9RRUAQJ3GCDMA&H=BQ2NOPXTM10D8I6K4VOMXSQQWYGA) Message From Customer
Service Hello,

I understand your concern. I'm happy to check this for you.

I've checked the order details for orders(#103-3025577-6673859
103-6670384-9158624), and can confirm that it's canceled by the
seller(Foscam Digital Technologies LLC). You weren't charged for the order.

The seller(Foscam Digital Technologies LLC) has cancelled your order
because the item is currently not available with the seller(Foscam Digital
Technologies LLC).

However, some banks may hold funds in your account for these
authorizations even if the order is canceled. You'll need to contact your bank for
assistance. They can tell you why funds on your account may be unavailable and
clarify how long they hold payment authorizations for online orders.

The sellers offering items on our website work hard to maintain their
inventories, but sometimes an item is unexpectedly out of stock when it comes
time to ship your order. This is bound to happen occasionally, but if we
find a seller's out-of-stock sales are excessive, we'll take action.

However, I understand that you still want the item and the Baofeng Black
UV-5R V2+ Plus (USA Warranty) Dual-Band 136-174/400-480 MHz FM Ham Two-way
Radio, Improved Stronger Case, Enhanced Features is available from another
seller on our site and fulfilled by Amazon. I'm happy to help you with the

shipping refund offer, so you can place a new order via One-Day Shipping directly from Amazon.com or order fulfilled by Amazon and write back to us with your order number. We'll waive off or refund the shipping fee completely. If the price has increased, we'll honor the same old price for your new order. For your convenience,

I have included a link to the product page here:

http://www.amazon.com/dp/B00HX03AMA
(http://www.amazon.com/gp/r.html?C=3GG4DES2VDURU&R=2RKVIWB2D1K8N&T=C&U=http://www.amazon.com/dp/B00HX03AMA?ref_=pe_584750_33951330&A=Y5XATUB7JGLOHYVZJIFVJRZDAHYA&H=CYRJAKAAUFV3ZLUK79GUA8QEUHMA)

I hope this information helps. We look forward to seeing you again soon.

Best regards,
Sakthi M.

Bob,

These are all mainly the same electronics in different cases. For example look at this list on the CHIRP website for all radios that program using the UV-5R model selection:

http://chirp.danplanet.com/projects/chirp/wiki/Baofeng_UV5R_Variants

So just pick the one that pleases your eyes.

Just be aware that some case designs are not compatible with all of the extra peripherals that you may want. For example, the extended batteries and AA/AAA-cell cases are particular on what cases that they will attach to properly. Some cases like the GT-3 don't fit all antennas and have problems with some programming cables and external mics fitting the socket properly.

You do realize that "Fulfilled by Amazon" means two things - one good and one not so good

The good... Your order will be shipped from an Amazon warehouse, very nearly untouched by human hands. If the item is stocked in more than one Amazon warehouse, your order will come from the closest warehouse that has the item in stock.

The not-so-good... You have absolutely no idea what seller's merchandise you will receive, no matter which seller is shown on the listing you ordered from. This makes seller ratings totally irrelevant. It also means that even if you have ordered the same item before from the same seller, you may not get exactly the same thing this time. The problem comes because whenever Amazon has multiple sellers who sell the "same item" through Fulfilled-by-Amazon, all their stock is mingled in the warehouse. It is all assigned the same item number in the computer system. When you order a widget from Seller A, Amazon credits the sale to Seller A. deducts one count from the Seller A inventory, and credits Seller A with his share of the selling price; meanwhile the order is electronically sent to the warehouse where a box with the appropriate item number is selected from the warehouse stock, prepared for shipment, and shipped to you. So far as Amazon is concerned it does not matter which seller provided the Widget that is being sent to you because all "Widgets" are presumed to be identical. In fact, Amazon has no record showing whose widget they actually sent you. Sellers using FbA are contractually prohibited from placing their name or other identifying markings on or in their package.

This really is a good system, so long as all the Widgets really are identical. But, if those widgets happen to come from China where items with the same name and same general description are manufactured in several small factories that don't always produce totally identical items, that could be a problem. Now what if these widgets all come from the same Chinese factory, but that factory has different Quality Control levels for widgets shipped to the US vs widgets sold on the domestic market; and what if that factory also sells widgets that failed even the domestic QC checks to recyclers, but some of those recyclers actually resell the widgets? So Amazon could have widgets from a real US seller who has US grade widgets, and more widgets from a different seller who gets his stock from a wholesale dealer in Hong Kong, and perhaps even a few widgets from a dishonest Chinese recycler. BUT so far as Amazon is concerned these items are all just "Widgets" - so you buy a "widget" and Amazon ships you a "widget" and neither you nor Amazon knows which widget you got.

Exactly what happened to me when I ordered a uv-5r"e" based on the picture
with a FbA for the seller on the online page. I received a model "a". The
seller argued that it was the same radio to me and amazon. I didn't know,
at the time this was being done at the Amazon distribution point.
I've been leery ever since.

Google Amazon's warehouse robot system. AMAZING to watch, if you haven't already seen it.

See this:

Amazon warehouse robots https://www.youtube.com/watch?v=quWFjS3Ci7A

https://www.youtube.com/watch?v=quWFjS3Ci7A

Amazon warehouse robots https://www.youtube.com/watch?v=quWFjS3Ci7A A look inside Amazon's warehouse where the Kiva robots are busy moving your orders around.

Guess what? Foscam Technologies *also sells under the name* Baofeng Radio US. Twice the listings increases their chances of you selecting one of their radios to purchase. If you purchase one, just look to see where it shipped from.

And Xuan's description of how Amazon's FBA system screws up the ratings system for third-party merchants on their site is normally why most run (not walk) away from using it - unless you are the sole widget maker (which is very unlikely).

I think almost all the radios are good and for $30.00 shipped you can't go wrong but they should have some one that can check to make sure your not getting a 5 year old VR5 in a new dressed up case.

I'm not going to bother with that HT,
It is nice but because it's so small the audio is sort of raspy.
However it picks up the weather station much better then my table top unit
I have here from Radio Shack,and that's with the stock antenna.
Can't beat the price and for $30.00 shipped you can work repeaters,Our one
is on a 1,000 foot tower.
BOB AF2Q

I've got 2 UV-5R's, which were actually sold as two slightly different models (don't ask what they were called as they were just UV-5R's on the boxes), but the only thing different between them is that one has a standard 1800ma battery and the other has the larger 3800ma battery. They both came in completely different boxes, but I can't see one "actual physical" difference at all on the radios. The two batteries fit each radio and I bought a couple of 6xAA battery cases for rechargeable batteries and they fit both radios,, OH,, YES I tell a lie, there was a difference. They had different antennas. One was about 50% longer than the other... The smaller antenna was notorious for breaking an internal connection and becoming useless until re-soldered. I replaced it with an Icom antenna with an SMA adapter, before it got the chance to break, and it is a bit better, but the larger antenna is quite good, and a lot more flexible..

The funny thing was that the one with the larger 3800ma battery and the longer/better antenna cost a bit less. Amazing... This has to be the most discounted radio EVER...!!!

Essentially, the 5R models are all the same except for maybe different casings, but there might be slight unseen differences in the firmware, then again maybe not - who knows...!!!

It's obvious that because there are so many different looking 5R's it is just a marketting ploy to sell many "different models"...

Very true, Richard, but that's also why guys (like Bob) can see 20+ versions of the same UV-5R radio. Always liked ZZ Top growing up, maybe I ask for the UV-5R ZZT label to be attached (marketing guys always say be the first or last thing for the customer to see). I could use the tagline "Gimmie All Your Orders...".

48921. Re: [baofeng_uv5r] ORDING FROM AMAZON

Yahoo group: baofeng_uv5r (2015)
Date: 2015-03-03 19:09:48 UTC
From: Xaun Loc
Topic: 48900 Message: 48921

I hate to be the one to try to explain the real world to you, but the explanation that Amazon gave sounds perfectly reasonable and very probable. When you use a credit card or debit card (especially a debit card) for a purchase, the first thing that happens is that the processing system checks to see if the card is valid and has money, the bank then responds with an authorization code - when that happens nearly all banks immediately process a 'pending' or 'hold' charge that locks a preset amount of credit or money to cover the expected charge. The exact amount depends on the bank and the category of store and has nothing to do with your actual or planned purchase. Ordinarily as soon as the actual charge goes through the bank clears the held amount and charges the actual amount. BUT if no actual charge comes in, it will take the bank some amount of time before they clear the hold. The length of time varies with each bank and in some cases with the kind of store.

If you have online banking and check your card balance shortly after buying gasoline on the card you will see a charge for some amount that is almost certainly not the amount of gas you bought. That is the hold amount your bank uses for a gas station. It might be one cent or it might be 50 or even 100 dollars. In a day or two, that charge will magically disappear and be replaced with the correct amount. If you use a credit card to check in to a hotel, your bank will hold AT LEAST $100, some banks will hold $500, until they get the final bill amount. If you pay cash or use a different card when you check out of the hotel, it will take your bank several days before they clear that hold on the card you used to check in.

A "pending" charge on your card after a purchase that isn't completed is NOT unusual and has nothing to do with the merchant - it really is a matter of how the banks and credit card processing centers do business.

Your Account Amazon.com

Message From Customer Service

Hello,

I understand your concern. I'm happy to check this for you.

I've checked the order details for orders(#103-3025577-6673859
103-6670384-9158624), and can confirm that it's canceled by the seller(Foscam Digital Technologies LLC). You weren't charged for the order.

The seller(Foscam Digital Technologies LLC) has cancelled your order because the item is currently not available with the seller(Foscam Digital Technologies LLC).

However, some banks may hold funds in your account for these authorizations even if the order is canceled. You'll need to contact your bank for assistance. They can tell you why funds on your account may be unavailable and clarify how long they hold payment authorizations for online orders.

The sellers offering items on our website work hard to maintain their inventories, but sometimes an item is unexpectedly out of stock when it comes time to ship your order. This is bound to happen occasionally, but if we find a seller's out-of-stock sales are excessive, we'll take action.

However, I understand that you still want the item and the Baofeng Black UV-5R V2+ Plus (USA Warranty) Dual-Band 136-174/400-480 MHz FM Ham Two-way Radio, Improved Stronger Case, Enhanced Features is available from another seller on our site and fulfilled by Amazon. I'm happy to help you with the shipping refund offer, so you can place a new order via One-Day Shipping directly from Amazon.com or order fulfilled by Amazon and write back to us with your order number. We'll waive off or refund the shipping fee completely. If the price has increased, we'll honor the same old price for your new order. For your convenience,

I have included a link to the product page here:

http://www.amazon.com/dp/B00HX03AMA

I hope this information helps. We look forward to seeing you again soon.

Best regards,
Sakthi M.

"It's obvious that because there are so many different looking 5R's it is just a marketting ploy to sell many "different models"..."

Al,

It's not so much an idea to sell many different model radios as an idea of how to allow the various dealers to compete against the Chinese sellers that can:

a) ship to the U.S. far cheaper than we can ship back to them (due to their government's subsidizing the shipping costs) and,
b) they are willing to ship non-FCC Part 90 radios (meant for the Asian market) or even defective radios into the U.S.

As Xuan correctly pointed out in an earlier post, Amazon considers all UV-5R radios to be identical widgets, so non-FCC rigs are mixed into the same Amazon inventory location as their higher cost American versions of the radios. Since Amazon refuses to separate one seller's inventory from another, the seller's create different model numbers (constantly) in an attempt to sell their inventory (and not someone else's) when the buyer selects a radio.

If six different sellers send Amazon radios (to be shipped out using Amazon's "Fulfilled By Amazon" or FBA shipping method) and you ordered 6 radios (on the same order) from what you thought was the same seller, you could easily get inventory from six different Amazon seller's (thinking they all came from one seller instead).

Because of inventory stunts like this, Amazon has been sued in court (but I'm sure their lawyers will tie that up for years).

Believe it or not, many Chinese sellers consider 4 watts on VHF and 4 watts

on UHF to be an 8 watt radio, so it would not surprise me at all if the
stickers claim the same thing.

Yes. There was quite a chuckle on Facebook the other day about a
webpage that was claiming to have an 8 watt UV-82. And down in the
body of the ad, it stated "4 watts VHF + 4 watts UHF = 8 watts".

It sounds like you used a debit card..... put back in MY account??

Well, that is perfectly normal to happen using debit cards. I know people who used a debit card to get gas, the gas companies placed a hold on more money then what was used, and people bounced checks cause of that.

As a matter of record, credit cards offer you more protections then debit cards does. Just because they both might say Visa or Mastercard, doesn’t mean they are the same,

Subject: [baofeng_uv5r] ORDING FROM AMAZON

As usual they took my money out then told me the seller canceled my order.
I was the one who canceled the order because I checked and they had 2 more coming my way.
My funds are still pending but they put the work load on me to take the money out of pending status and put it back in MY account.
Amazon people lie a lot.'Now they say the seller ad none in stock.
Read below
BOB AF2Q

Your Account Amazon.com

Message From Customer Service

Hello,

I understand your concern. I'm happy to check this for you.

I've checked the order details for orders(#103-3025577-6673859
103-6670384-9158624), and can confirm that it's canceled by the seller(Foscam Digital Technologies LLC). You weren't charged for the order.

The seller(Foscam Digital Technologies LLC) has cancelled your order because the item is currently not available with the seller(Foscam Digital Technologies LLC).

However, some banks may hold funds in your account for these authorizations even if the order is canceled. You'll need to contact your bank for assistance. They can tell you why funds on your account may be unavailable and clarify how long they hold payment authorizations for online orders.

The sellers offering items on our website work hard to maintain their inventories, but sometimes an item is unexpectedly out of stock when it comes time to ship your order. This is bound to happen occasionally, but if we find a seller's out-of-stock sales are excessive, we'll take action.

However, I understand that you still want the item and the Baofeng Black UV-5R V2+ Plus (USA Warranty) Dual-Band 136-174/400-480 MHz FM Ham Two-way Radio, Improved Stronger Case, Enhanced Features is available from another seller on our site and fulfilled by Amazon. I'm happy to help you with the shipping refund offer, so you can place a new order via One-Day Shipping directly from Amazon.com or order fulfilled by Amazon and write back to us with your order number. We'll waive off or refund the shipping fee completely. If the price has increased, we'll honor the same old price for your new order. For your convenience,

I have included a link to the product page here:

http://www.amazon.com/dp/B00HX03AMA

I hope this information helps. We look forward to seeing you again soon.

Best regards,
Sakthi M.

Exactly what happened to me when I ordered a uv-5r"e" based on the picture with a FbA for the seller on the online page. I received a model "a". The seller argued that it was the same radio to me and amazon. I didn't know, at the time this was being done at the Amazon distribution point.
I've been leery ever since.

Ko4lloyd

On Mar 3, 2015 7:46 AM, "'Xaun Loc' xaunloc@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com> wrote:

You do realize that "Fulfilled by Amazon" means two things - one good and one not so good

The good... Your order will be shipped from an Amazon warehouse, very nearly untouched by human hands. If the item is stocked in more than one Amazon warehouse, your order will come from the closest warehouse that has the item in stock.

The not-so-good... You have absolutely no idea what seller's merchandise you will receive, no matter which seller is shown on the listing you ordered from. This makes seller ratings totally irrelevant. It also means that even if you have ordered the same item before from the same seller, you may not get exactly the same thing this time. The problem comes because whenever Amazon has multiple sellers who sell the "same item" through Fulfilled-by-Amazon, all their stock is mingled in the warehouse. It is all assigned the same item number in the computer system. When you order a widget from Seller A, Amazon credits the sale to Seller A. deducts one count from the Seller A inventory, and credits Seller A with his share of the selling price; meanwhile the order is electronically sent to the warehouse where a box with the appropriate item number is selected from the warehouse stock, prepared for shipment, and shipped to you. So far as Amazon is concerned it does not matter which seller provided the Widget that is being sent to you because all "Widgets" are presumed to be identical. In fact, Amazon has no record showing whose widget they actually sent you. Sellers using FbA are contractually prohibited from placing their name or other identifying markings on or in their package.

This really is a good system, so long as all the Widgets really are identical. But, if those widgets happen to come from China where items with the same name and same general description are manufactured in several small factories that don't always produce totally identical items, that could be a problem. Now what if these widgets all come from the same Chinese factory, but that factory has different Quality Control levels for widgets shipped to the US vs widgets sold on the domestic market; and what if that factory also sells widgets that failed even the domestic QC checks to recyclers, but some of those recyclers actually resell the widgets? So Amazon could have widgets from a real US seller who has US grade widgets, and more widgets from a different seller who gets his stock from a wholesale dealer in Hong Kong, and perhaps even a few widgets from a dishonest Chinese recycler. BUT so far as Amazon is concerned these items are all just "Widgets" - so you buy a "widget" and Amazon ships you a "widget" and neither you nor Amazon knows which widget you got.

Hey Bruce

Usually Amazon states the seller with website and location. It also has the rating of the seller based on customer feedback.

But again buying online = Globalization in action.

My 2 cents.

Hi Bruce,
I went back with a debit card and xxxxxx Bank again.
Now when I want to but something on line I have a limit that may be
$100.00 so if Amazon tries to sell and ship me 3 HT's again,my bank sends me a
text or E mail saying a purchase fir $155.00 was made.
This is over your limit so please call this toll free number to confirm
that you want the funds released.
So I call them and tell them no then I call Amazon and cancel the order
and inform them that by bank is watching your activity very close.
About 3 years ago I ordered a HT when this list was just getting started.
They said it was in stock so I ordered 1.
Yes,it was in stock in China -) .
Two nights later my printer kicked in and a form was spit out saying I
ordered 2 more of the HT's.
I called my bank and they said when it arrives not to touch the package
and tell the mail girl to send it back.
I was refunded for 2 because they said they never received a third unit.
So what I do now is go to my accounts and change 1 number on my card.
When I order an item and they try grabbing money before the item was
shipped they contact me and I tod them to let me know if it was shipped.
I have no real problems with them now because 1 phone call and they can't
do a thing.
Thanks Bruce because I never knew credit and debit cards worked different.

Don't spend any extra money to get one that goes up to 520 MHz. They all do. Even my nearly 3 year old UV-5R (BFB231) goes up to 520 MHz after increasing the UHF band limit with CHIRP (or the OEM VIP software). And you would probably have to special order one to get one that isn't set to 520 MHz. I don't know why vendors still use ad copy that still states a UHF range of only 400-480 MHz. They haven't shipped that way for a couple of years.

BFB296 and BFB298 are VHF/220 radios instead of VHF/UHF.

BFB297 means nothing any more because all firmware versions after BFB297 report BFB297 (BFB298 for VHF/220 radios) during the [3] key + power-on message. If it is a new radio, it will have N5R{something} firmware. You have to use CHIRP to determine the "real" firmware version.

I can answer that, the Chinese government had a restriction on the upper
limits above 480 mhz. So the ones still marked at 480 makes the Chinese
government happy and most likely are ones sold for their domestic markets.

This is why many end at 480 coming from the Chinese suppliers.

(This info came from a factory supplier)

This may be true, but they must only limited to 480 MHz by the label.
I haven't received a "factory" CHIRP Radio Image (*.img) file from
anyone for a couple of years that has the upper UHF limit set to
anything other than 520 MHz.

Their showing the PX888K as a 9 watt HT
http://www.amazon.com/JINTO-Hi-quality-Transmit-Distance-Px-888k4w/dp/B00MVUC5SW/ref=sr_1_2?s=electronics&ie=UTF8&qid=1425456584&sr=1-2&keywords=puxing+px-888k#productDetails
---
Frequency Range: VHF 136-174 MHz UHF 400-470MHz
Output Power: 9 Watts
128 Channels 50 CTCSS and 104 DCS
Built-in VOX Function
Large LCD Display
Hight /Low RF Power Switchable
25KHz/12.5KHz Switchable
Emergency Alert
Low Battery Alert
FM Radio
Battery Saver

Strange thing is that the battery 1600 Mah vs 1800 like I have in mine.
Also the newer PX777k does not have many good reviews an the PX888K

Read the product (not seller) reviews of any product likely to come from China - especially electronics - and you will see a large number of 5 star reviews and a large number of 1 star reviews for the same product. Now read the content of the reviews. Quite a few will be short and useless, but if the product has any significant number of reviews you will see enough reviews to make it obvious that some customers received a quality product and other customers received junk. Some of this discrepancy can be attributed to poor Quality Control at most Chinese factories -- but much of this discrepancy is due to the fact that the "same" product comes from several different sellers, some of whom sell a quality product and some of whom are selling products that any American factory would have destroyed as rejects or sold cheap as 'seconds'

And Xuan's description of how Amazon's FBA system screws up the ratings system for third-party merchants on their site is normally why most run (not walk) away from using it - unless you are the sole widget maker (which is very unlikely).

Subject: Re: [baofeng_uv5r] ORDING FROM AMAZON *THANKS BRUCE**

Hi Bruce,
I went back with a debit card and xxxxxx Bank again.
Now when I want to but something on line I have a limit that may be $100.00 so if Amazon tries to sell and ship me 3 HT's again,my bank sends me a text or E mail saying a purchase fir $155.00 was made.
This is over your limit so please call this toll free number to confirm that you want the funds released.
So I call them and tell them no then I call Amazon and cancel the order and inform them that by bank is watching your activity very close.
About 3 years ago I ordered a HT when this list was just getting started.
They said it was in stock so I ordered 1.
Yes,it was in stock in China -) .
Two nights later my printer kicked in and a form was spit out saying I ordered 2 more of the HT's.
I called my bank and they said when it arrives not to touch the package and tell the mail girl to send it back.
I was refunded for 2 because they said they never received a third unit.
So what I do now is go to my accounts and change 1 number on my card.
When I order an item and they try grabbing money before the item was shipped they contact me and I tod them to let me know if it was shipped.
I have no real problems with them now because 1 phone call and they can't do a thing.
Thanks Bruce because I never knew credit and debit cards worked different.

BOB AF2Q

In a message dated 3/3/2015 4:42:04 P.M. Pacific Standard Time,
baofeng_uv5r@yahoogroups.com writes:
It sounds like you used a debit card..... put back in MY account??

Well, that is perfectly normal to happen using debit cards. I know people who used a debit card to get gas, the gas companies placed a hold on more money then what was used, and people bounced checks cause of that.

As a matter of record, credit cards offer you more protections then debit cards does. Just because they both might say Visa or Mastercard, doesn’t mean they are the same,

Bruce

By the way, the "FCC logo" is only related to Part 15 compliance as an UNINTENTIONAL radiator -- which means that the radio won't put out too strong a signal while it isn't transmitting (yes, these radios do put out a signal while they are NOT transmitting - as so all modern radios).

Subject: Re: [baofeng_uv5r] Re: uv-5r and uv-82 power output

You will see an FCC logo on the radios and this has peaked some interest from certain parties. They are now making/shipping 10W vhf models (not uv5R versions) The batteries are huge and the radios are thicker for these models.

So now 10W versions of certain radios are out.

From: beargyrils@...
Topic: 48963 Message: 48963

Looking and reading a lot on the PX888K,It looks almost like the older UV5r series's HT's
Still cheap but again about $22.00 more then the one baofeng I was looking at.
I also see they lowered the capacity of the battery.
Mine is going on 3 years old now and never had a problem and the battery holds up like it was new so I the PX888K is what i'm going to buy.
Why the Px777k has so little feed back and only one or 2 stars I don't know but I think I may get that HT also.
I can always return it.
Larry from CVS electronics is away now but as a few higher capacity batteries laying around/

Bob,

By all means, buy one. I'd fully recommend this Chinese made radio. Some might argue that you only ever get what you pay for and usually that's a time proven statement.. However, in the case of the UV-5R, in my mind, it is one exception to that rule. You certainly can't dispute the fact that you sure get your moneys worth out of it, and then some - on average,, and the "bang per buck" ratio goes off the end of the scale in favour of getting one. Can't remember if I said in the last post or not but if you do buy one, my recommendation is to buy a standard model UV-5R. The reasons..

1. If you do have any queries, troubles and need answers or advice for, the standard model is the most likely to yield those answers, from other owners/users..
2. Buying accessories. You don't have to worry " Will it fit my model?", because for the most time,, it will..
3. Software and programming - need I say any more (same as above)..
4. You wont be missing out on a single thing over any other model, because they come from the base 5R..

Sooner or later I am going to buy a Yaesu FT-60 H/H, just to get back on track, but as long as I have the UV-5R(s) at my side for the meantime, I am resaonably content. I'm afraid the FT-60 will have to wait a little while longer for the immediate moment, but I'm not too upset. It'll happen.. Between now and then, the UV-5R, I'm sure, will suffice...

Al

There are SSSOOOOO many versions of the UV5R which are either identical or similar. I originally purchased a couple BFF8+ and like it with one exception, the always dark (inverted) display. I like not having a band button. I want to get one which is as much a duplicate as possible but with the standard display and possibly the metal front, not that it looks like that much protection. This is to be a knock-around, leave in the truck all year radio and I want to use the same CHIRP profiles unless there is a different firmware in which case I would still program the same. I would likely buy from Amazon just for convenience. Yes I know about the possible substitution.

My question is: what model is the one I am describing? From what I can tell the Foscam UV-5R V2+ seems to be it, but I don't know about the chipset gen. This says it is the 2014 chipset and the BFF8+ says it is the 2013 chipset. I don't know if there is even a difference. Warranty is nothing for $30.

Does anyone know offhand what model is the closest thing to what I am describing? There are just soooo many...

I remember the Icom V82 and U82 having a 7 watt output. There are rules dealing with specific absorption rate (SAR). How this goes into any specific rules for power output I do not know. I, myself am not going to get into this fight. I don't consider power output a determining factor in buying an HT.

The Puxings are kind of overlooked. I have some 888Ks as well as a
UV973. I prefer the UV973, as the transmit audio on the 888k is a
little muffled.

If you don't mind paying a little more, get the BF-F8HP. It has the classic UV-5R case, regular LCD display and is sold on Amazon.

Otherwise, you want a UV-5R. Don't worry about the chipset or firmware version. They don't really matter that much (unless you get one from about 6 months ago that has the BEEP bug, the [EXIT] key sends DTMF 0 instead of DTMF D, or one of a few radios that currently isn't working with CHIRP).

OK I almost paid a lot of money for a 220 and a 2 meter HT
Both are no longer made so I went back to Amazon and from what I read it
seems I need the cord to program it.
I'm trying to get away from that since I don't use many of the features.
$30.00 sounds good but I rather pay a few more bucks and site here and
punch in what I want.
Any suggestions?

I used CHIRP yesterday to read and write froma UV-5R (Kenwood type cable)a IC-2100H (used an old serial Icom cable)a FT-857D (used a CAT cable)
So now I know I should be able to programany of the supported big 3 radios.
I swapped repeaters between the 3 radiosby using copy & paste. It even got the tags.
There is no way I'd even try to hand
program one of my P25 digital scanners.

I don't think you can tell which chipset is used unless you open it up
and look.

I bought a UV-5R in 2013 and a UV-82 last fall. I opened them both up a
few weeks ago and they both had the the same SDR and FM chips.

If you want a 1-1/4 meter radio and a 2 meter radio, why don't you just buy a UV-82X. It covers both bands and can be programmed using the keypad. $50 with free shipping on Amazon (Baofeng Tech).

BFF8 - the reversed screen version
Turn all color options to purple and set battery saver to off.
Now when you receive send or touch any button the lite will turn on and stay on for the amount of time specified in the "BackLight" option.

I have had a UV-5R+ for two years. I lost it on a summit after a SOTA activation and only realised when I got home. The following morning I found it, luckily it was tuned to my local repeater and there it was in the dew soaked grass bleating out the morse ident of the repeater and still to this day it is non the worse for the experience.

After two years the battery still lasts all day, it still works well S2S, giving me 95+ miles no sweat with reports of 59

I have just ordered a second radio today, the new 2015 model, the Baofeng Misuta (UV5R) 'Hero'

http://www.baofengradio.co.uk/brands/Baofeng-x-Misuta.html

I will keep the old one in the car for emergency.

And yes, a £20 radio that does all of this, what is that in USD? $25? A round of beers in a British pub would cost more than that!

Awesome, you can't go wrong! You won't regret the purchase.

This group adds a lot of value to the radio as you have found. John and Jim are both a font of knowledge, the Miklor.COM website has everything you need to answer all questions, but in case you can't find the answer, the chaps here are always friendly and helpful.

Good luck

The backlight works fine. Tap exit to light without making anything happen. It also stays lit for 24 secnds, the max. My complaint is that the inverted/reverse display is always (lit or not) harder to read than the standard or at the very least you have to turn on the backlight just to read it. The standard display is readable in all but very dim light without backlight. The only advantage I see is in clandestine night ops. When lit it won't light up your face.

The problem is there are so many UV5R HT's but they all have their own feature.
None or very few are the same.
I see some around $60.00 then you would want the MIC and a spare battery and we all now the antenna is the pits so now your cheap HT is much higher in price.
I purchased several WOUXUN HT's so I have a lot of extras and 3 are 2/ and 220 and I can program them manually.
But it's always nice to have one UV5R but Amazon sold me a 2014 and it turned out to be a 2012 unit and things like that bothers me.
Just look at all the UV5R T's at $30.00 and one is the latest version UV5R-2 so it get pretty confusing

Bob, I guess you just learnt the dark secret of the group, there is no one banning people who don’t know how to get along in a friendly way with others. Some people know their personality is a losing one, so they enjoy making enemies, not friends.

Personally, this person and another, I set up a email rule that any incoming email from these people goes into the trash bin.

Modern 3 in 1 printers that have Wi-fi built in, come with email addresses. You can auto forward emails to your printer. Some people like paper emails to read. No big deal.

Your the one with a tin hat that's to tight.
Didn't you ever hear of sharing printers?.
Auto responder goes to my bank and if the value is over my limit that I set the bank bots get notified.
Also I now have it set up with Amazon.
How did you think I found out I was getting 3 HTs one time and 2 just last week?

Not sure wat your getting at.
I know what I have here with my printer and you came out with the remark.
I thought the tin foil hat remark was a joke
Right now I am reading that the UV-5R V3+ is an upgraded UV-5R V2+
Another site says don't buy the HT unless it say sold by Baofeng when your
viewing it on Amazon.
Firmware is never listed and I read where one ham had the older firmware
in the 2015 HT.
I did manage to get 1 repeater in the UV-5R-V2+ but it took some time to
figure out I had to hold the EXIT button down for a good 2 seconds

Nope. The band button hasn't been needed for entering frequencies into the VFO for quite some time. The radio determines the band from the first digit entered.

1 = VHF
4 or 5 = UHF

For those radios that have the [BAND] button, if it is pressed while the [PTT] button is activated, a 1750 Hz (2100 Hz in some models) tone burst is transmitted over-the-air.

Hi Bob

The BaoFeng UV-5R announces the mode its in, frequency mode or channel mode when it powers up. Was your radio charging on the table, or did you turn it on?

I do not think it should simply power up on its own out of the blue?

Welcome to the UV-5R Family. I am sure you will enjoy your new radio.

Hi Wassim,
It;'s been sitting on the table and I was going to see how long the battery would last
That's just what it did after the late night hams signed off.
Made 2 beeps then the voice said frequency mode and I never touched it.
The other guy may be right.
Indication of a low battery but i'm just leaving it there and let it do what it wants to do.
I watched U tubes on that UV5R and it's looking good.

The problem is there are so many UV5R HT's but they all have their own feature.
None or very few are the same.

If you are talking about the UV-5R family of radios then actually, Bob, they are just about ALL THE SAME -- not quite 100% but more than 95% of these radios ARE exactly the same inside. They have exactly the same circuit board, with exactly the same functional components, and functionally identical firmware.

Yes, some firmware versions have slightly different bugs - BUT they all work the same and the bugs are basically trivial matters such as whether or not you can turn off the keypad beep or whether or not one particular DTMF tone is correct

Yes, some versions dropped the "Band" button -- BUT that button is completely unnecessary on the versions that do have it -- and the radios that don't have the "band" button still have the same circuit board with the same place for the button, they just don't bother soldering one to the board.

Yes, vendors list different functions in their advertisements for their radios BUT as mentioned above all the radios themselves have the same functions.

The only real differences are that a few models come with the circuit board inside a slightly different plastic case - BUT most vendors have already discovered that using an incompatible case style is bad for sales so almost all the currently available models use one of the standard case styles.

A few vendors do repackage the radio with different accessories BUT all those accessories are available individually (often for less than the bundled cost).

There are some other BaoFeng radios that are based on the UV-5R but at not actually the same, such as the "high power" versions -- but the reality is that even those radios really have the same features and functions other than the nominal RF power output (and the difference in power output is less slightly less than 3dB which is trivial in the real world of VHF/UHF FM voice communications).

I put all of my 2m & 70cm antennae including the tiny UV-5R antenna on a Time Technology T100 vector antenna analyser this week, and surprisingly out of all the non 'resonant' antenna, the little one, the stubby, was the best matched for 2m and 70cm, especially when the antenna was in a 'hand held' position (as if your hand was gripping the hand portable and lifting it up to speak). I was surprised, I had expected it to be the worst. My battery has not gone flat once, so no real need for a spare yet. I bought the speaker mic, didn't like it. much prefer using it hand held. You really don't need to spend a dime more than the basic article as it is shipped in the box - apart from maybe the programming cable :-) but you could share one of those with a friend or friends.

Omg how many days of repetitive talking about every little silly thing, over last few days my emails have blown up from this group. Can I suggest for long term talking it's easier to talk in a chat or on a post in facebook. Especially ever little aspect of a purchase, have we discussed what materials they made from, or maybe the colors. Do any come with a toilet paper roll holder too? If you want a baofeng radio, go to their website, compare radios, and buy one. that's not hard is it, ohh but so many choices...I mean, I don't think it could have got any harder to find and purchase a radio than what I've read this past week..but wait this one comes with this antenna and faceplate different than this other one. Omg decisions. If you want a baofeng get a baofeng from a baofeng dealer..aka baofeng tech on amazon, want a off band in a different case, then order one. I mean never had issues with payments or delivery of anything from Amazon, but I choose to deal with reputable dealers. It's not this hard is it?

No rule limiting to 5W obviously since they've granted 8W units.

The BF-V9V2 grant (ZP5BF-F9VW) for example says "Body-worn SAR compliance is limited to belt-clips, holsters or similar accessories that have no metallic component in the assembly and must provide a minimum of 2.5cm separation between the device, including its antenna, and the user's body"

Hard, if not impossible, to do that with a belt clip worn on a typical belt.

Putting it in a holster on a duty belt should might get you there.

The BF-5R (ZP5BF-5R) at 1.3W is 1.5cm separation required.

The BF-82 (ZP5BF-82) at 5W is 2.5cm also. So the added 3W didn't change that.

All these are based on 50% duty cycle and I can't imagine very many people doing that much transmit traffic.

But have to wonder how many Part 90 outfits actually check their people for compliance with the grant? I'll bet it's pretty close to zero.

Mike W9MDB

SAR compliance is an operator issue. I doubt that very many users are operating the BF-82 with the belt clip on their belt while transmitting (yes, it certainly CAN be done, with a speaker-mike, a headset, or a very friendly helper, but most people take the HT off their belt to transmit)

Subject: RE: [baofeng_uv5r] Re: uv-5r and uv-82 power output

No rule limiting to 5W obviously since they've granted 8W units.

The BF-V9V2 grant (ZP5BF-F9VW) for example says "Body-worn SAR compliance is limited to belt-clips, holsters or similar accessories that have no metallic component in the assembly and must provide a minimum of 2.5cm separation between the device, including its antenna, and the user's body"

Hard, if not impossible, to do that with a belt clip worn on a typical belt.

Putting it in a holster on a duty belt should might get you there.

The BF-5R (ZP5BF-5R) at 1.3W is 1.5cm separation required.

The BF-82 (ZP5BF-82) at 5W is 2.5cm also. So the added 3W didn't change that.

All these are based on 50% duty cycle and I can't imagine very many people doing that much transmit traffic.

But have to wonder how many Part 90 outfits actually check their people for compliance with the grant? I'll bet it's pretty close to zero.

George,

Perhaps Wikipedia should modify their posting to something like this:

Ad nauseam is a Miklor and a Baofeng User Group term used quite often for a discussion that has continued so long that it has continued "to [the point of] nausea". <http://en.wikipedia.org/wiki/Ad_nauseam#cite_note-1> <http://en.wikipedia.org/wiki/Ad_nauseam#cite_note-2> For example, the sentence "This UV-5R topic of what minor changes one radio has vs. another, or what various sellers did (or didn't) do in a particular sale has been discussed *ad nauseam*" signifies that the topic in question has been discussed extensively, and that those involved with the discussion have grown tired of it.
Of course we also have to credit the folks (normally new to radio - but not always) that continue to discover "*breaking news*" features of discussion as well, like how some UV-5R radios are marked for 480 MHz UHF band limits (while others are 520 MHz), or missing "Band" buttons, and of course the somehow unending discussion of one duckie antenna to another (you'd think spending a few bucks to actually try one would financially break these folks and ruin their retirement accounts).

At least they provide a laugh or two during the workday ....

Don't forget the people that think they are too good to check the readily available FAQs and the other great source of info of the Miklor site. Can it get any easier to find the info, than at the bottom of each and every email sent through the Yahoo Group? "My problem is so unusual that NOBODY ELSE COULD POSSIBLY HAVE RAN ACROSS THIS BEFORE!" Most of these "ad nauseam" discussions have been had a minimum of 10-15 times apiece. It would be a rare occurrence to actually come across a new problem. I do like it when someone indicates they checked the website, FAQs, and past conversations and still could not find an answer.

Jardy

I've been guilty of asking noob questions even though I've been using the Miklor website in an attempt to find answers, as well as other online resources.
Miklor is a wonderful resource full of great content, which I had never been able to find as I had always struggled to navigate the website. A lot of the content I had seen seemed to be elusive and impossible to navigate to from the home page. I had never realised that the words in a bold black font were hyperlinks. Other links were in the traditional blue hyperlink color. I had always foolishly thought it was work in progress and that one day these words would eventually be mage into working hyperlinks :-/

I only discovered this when looking at the recent link John had posted in reply to my question I posted a week ago. I got thinking "how on earth would I find this page again?" And thought to myself that maybe he created that page quickly in response to my question, or why wasn't this linked to from the home page if it already existed? When I got to the home page I saw the words eventually (bearing in mind that most people looking for resources only scan for hyperlinked words in blue and ignore everything else.) Obviously I feel like kicking myself now.

Jardy,

After checking both the Baofeng group and Miklor I think you are the first to uncover the "ad nauseum" error.....lol

Just joking !!!

Sent from my iPad

One excellent reason to check the FAQ's and Miklor's site is the immediacy of the answer. By asking questions to this group, it takes time for a reply, and sometimes I can't wait. I do like reading the replies when things aren't time sensitive. I pick up a lot of info that never would have occurred to me (to even ask). Just want to thank everyone here for sharing their knowledge. I have been a lurker here for about a year. The UV-5R is the reason I got my ham general ticket. I bought it, then figured I needed to get license to talk on it! Thanks again. Ed KK4VYY

49017. BF-F8+ no tx power

Topic: 49017 Message: 49017

I have had my BF-F8+ for a week now has been working great. I used chirp to program my radio and now I get 200 MW on vhf and 1 watt on uhf i used chirp to program this radio the firmware is N5R2401 the version of chirp is 0.4.1. I downloaded the data form the radio and added one 2 meter repeater I had forgot to add when I first programmed the radio a week ago and now. I have this problem I have reset the radio & re upload the stock image I saved from this radio also tried this using the latest daily build. Has any body else has this happen?

I just received my third of four UV-5R radios a couple days ago. This one has a bad charger and doesn't act anywhere like my other two chargers. First, the power plug to base connection is flaky and you have to find a sweet spot for making contact. (I have not opened it up to see what is going on.) Second the red light does not always come on when the battery needs charging and doesn't want to go to green when the battery is charged. I'm basing all this from experience with my other two chargers coming with the radio. Apparently poor battery chargers coming with the radio are pretty common.

After reading some prior posts, I have already ordered a couple better chargers for the radios.but they are still in transit. When I have a little time I'll open up the bad one and see if I can see what is going on. The plug assesment should be fairly easy to perform but why the RED light either doesn't want to come on or go out when the battery is charged is a mystery. Maybe a flaky IC.

It is typically flaky soldering (or no soldering at all) in places. This was a common problem nearly 3 years ago. It improved to the point where it was rarely mentioned. It is back to being a problem again (I'm reading reports of faulty chargers almost daily now).

Could be a flakey chip, but there is a good chance that the problems are due to connections that either aren't soldered at all or are poorly soldered. Apparently China is about the last place where electronic items are still individually hand soldered and with no one checking them it isn't unusual for the job to be done poorly or not at all.

From your date of license, I assume you are familiar with what a good solder joint should look like. For the sake of newer hams reading this, just Google the term "cold solder joint" (with or without the quotes) and look at the pictures that come up.

Subject: [baofeng_uv5r] I have so many HT's now

I went for another WOUXUN dual band 220 and 2 meters.
Reason is I see many sites no longer sell the dual band with 220 in it.
I have the old RS 2 meter HT's and the 2 WOUXUN dual band and one with 220 in it.
Then my old Alinco has 220 single band.
HRO is no longer selling the small SPKR MICS for the WOUXUN HT.
Anyway I found this bit of information and I also watched a couple U tubes on manual programing the WOUXUN HT's for the KGUV3D

I love my 2 UV-82 Buttfangs with 771 antennas. They get out to my local repeaters easy, even inside my aluminum siding house :) I'm replacing them with better gear. And I'm not a prepper so they aren't BOB stuff to me, so I don't use them. I'll donate them to my local club that pays for my repeaters. I hope they will get use. They rocked. I've got a Kenwood 281a and will be getting something for 20M soon so the HT's don't get used.

Have you set the squelch level properly?

Set for one of the NOAA weather channels, as they transmit continiously. Good test.

CTSS is generally needed only for transmit.

Does the built-in FM radio work correctly?

Have you looked at the tutorial on the web as to how to set up the radio? Youtube is your friend!

49046. UV-B5 observations/questions

Yahoo group: baofeng_uv5r (2015)
Date: 2015-03-07 17:51:46 UTC
From: no6b@...
Topic: 49046 Message: 49046

First, I know that there's a UV-B5 Yahoogroup but apparently it's either closed to new members or there's a problem with the Yahoogroup interface as I'm unable to join it, so I hope we can discuss the UV-B5 here in the meantime.

I recently bought a UV5R & was a bit disappointed with the poor RX out-of-band rejection. Many signals that sounded noisy on the UV5R sounded fine on my other HTs despite the fact that the UV5R's RX sensitivity measures much better (0.13 uV) than my other radios. By looking at the UV5R schematic, I discovered that the apparent reason for this is because there are a pair of LNAs (band-split, one for each band) feeding the RDA1846 FM transceiver IC. My tests with other boards that use this chip showed that this really isn't necessary IMO, as the RDA1846's intrinsic sensitivity is around 0.21 uV, & also has pretty darn good 3rd order spur-free dynamic range of 73 dB (which is why it didn't make sense to me initially that the UV5R performed so poorly in a high RF environment). So while looking around for some board layout pics of the UV5R to find the LNA transistors so I could bypass them, I ran into some product reviews for the UV-B5 & B6. I was surprised as the number of reviewers that remarked how much better the UV-B5/B6 RX is at IMD rejection as compared to the UV5R. So for $37 I figured why not try it. Well I just got my B5 & without even going outside to give the RX a good workout, I noted some stark differences, some good & some bad:

-The "wide/narrow" setting not only sets the TX BW, but also (unlike the UV5R) also changes the RX BW. This is a big plus for VNBFM usage, as the RX is now actually 12.5 kHz-capable.

-The memory programming procedure has been simplified in that you don't have to program the RX & TX frequencies separately, but if you need to program in a non-standard offset or "odd split", you need to change the offset before programming into memory. B5 memories do store offset amount & direction, unlike the UV5R. I also don't yet see a way to delete memories (maybe there's a way via computer programming; I've yet to buy a programming cable - just too used to doing that all from the radio).

-STE time is no longer adjustable, like it was on the UV5R.

-It's no longer possible to enter the 2-digit menu number of the function you want to access after pressing MENU. Once you hit the 1st digit it takes you straight to that function. The UV5R is smart enough to look for a 2nd digit so you can enter 1 or 2 digits to get to all the menu functions with just 2 key presses. With the UV-B5 it looks like your only choice is to scroll up & down through the menu. Since the B5 has a channel select knob, you can scroll a bit faster through the menu selections but still prefer the UV5R's menu selection method.

-CTCSS reverse-burst appears to be implemented properly in the UV-B5. WIth RX CTCSS enabled on the UV5R I still get a squelch crash when my repeater, which sends reverse burst from a G.E. Mastr II encoder, drops. However, the B5's RX mutes upon receiving the reverse burst. I also noticed that if a received signal with the proper CTCSS drops & there is a weak signal without CTCSS underneath, the radio continues to receive (doesn't stop decoding). This is probably a minor issue, for as soon as the weak signal either drops below the

squelch setting or gets stronger, the B5 stops decoding. But the UV5R doesn't have this problem.

-A bit more serious CTCSS decode issue: the decoder is a bit wide, & will decode the next tone down as well as the one you've selected. So if RX CTCSS is set to 107.2, it will decode that as well as 103.5. The one exception is 114.8: if you select that it won't decode at all (a nice way to mute the UV-B5's RX if you just want to listen to FM uninterrupted). So if you need to decode 114.8 you can set RX CTCSS to 118.8 & it will decode 118.8 and 114.8. The 114.8 no-decode bug is documented on the miklor web site, though they are less specific about the "next tone down decode" issue.

-Stepping through the channels on the B5 (using up-down keys or the knob) when the voice prompt is on is painful because it won't step until it's finish says the channel number. Entering channel numbers from the keypad gets around this, otherwise you'll just have to turn the voice off.

The received audio bandwidth on the B5 seems to change depending on several unknown factors. But generally, when you first tune to a channel it often sounds very band-limited for a couple of seconds. Obviously some artifact of the DSP in whatever SDR chip this radio uses. Between this & the CTCSS decode problem, I don't think this radio uses the RDA-1846.

OK that's the most of it. Will report back on RX IMD performance as compared to the UV5R later.

Probably because you have never learned how to read emails.

This is undoubtedly exacerbated by the fact the various people here used different email clients and those different email clients format their quoted replies differently.

And further complicated by the fact that polite users trim quotes, but sometimes when trimming a quote they may trim out the entire portion that was written by the poster whose message they have replied to.

If you go to the group website to review the message history, you should be able to find your post which was the source of the quoted material - but you will find (exactly as shown in the section you quoted) that the two lines of text were not written by you, but DID appear as a quote in a reply message posted by you.

No Baofeng actually HAS reverse-burst. They use their own proprietary
system for squelch tail elimination. If, however, you have discovered
true reverse-bust, then this is new.

Some people have observed, with STE on, there is a kind of "click-click"
transmission after they unkey.

From: Tom Consodine ND5Y
Topic: 49046 Message: 49051

On the Baofeng UV-5R, UV-82 and at least some Wouxun models "reverse burst" is really the CTCSS tone changing to approximately 55 Hz for about 1/4 second when you unkey, instead of shifting the phase of the tone as is the industry standard at least in the USA. That is what the "click-click" delay is when you unkey with Menu 35 STE ON.

You can't disable the receiver from muting when it receives the 55 Hz tone. If somebody wanted to make a Baofeng-proof system all you would have to to is transmit a custom 55 Hz CTCSS tone all the time and nobody with Baofeng radios would be able to receive anything unless they held down the monitor key at all times.

I don't know if this is really proprietary to Baofeng or something that is commonly used in China since some Wouxun models also have it.

The strange thing is that the RDA1846 SRD transceiver chip data sheet says it has phase shift reverse burst capability with selectable 120, 180 or 240 degree phase shift and doesn't mention anything about 55 Hz STE.

I just tried this: actually any tone from 49.5 to 60.0 Hz will mute the
B5's RX. Wait, isn't that their other brand name: Anytone ;) Also scary
that 60.0 Hz is right on the ragged edge of muting: sometimes it will &
sometimes it won't.

Fortunately, turning STE off on the B5 disables this behavior. Also, the
UV5R's STE "range" is narrower: 53 to 58 Hz.

It's possible that both frequency & phase shift are occurring at the same
time. Might explain why the B5 RX responds to the reverse burst from my
G.E. encoder.

I tried that. I do get a link to click to subscribe, but that only takes
me to a web page to send a subscription request, which doesn't seem to work.

Hello All,

I've read the FAQ's, yet I find the instructions to be vague. I've using the latest daily build, yet I cannot figure out how to change the Settings to Name so that the radio displays the alpha part, or assigned name on it's display. Using CHIRP I've programmed many eariler versions successfully, but the new firmware has been changed. Thank you for the help.

I wasn't making any stink about it (big or small) -- You asked why some emails seemed to identify you as the author of quoted material that you had not written. I pointed out that, despite your name being included in the quoted portion of the message, those emails may or may not have been showing you as the author.

I was explaining that figuring out email entries such as those used to identify quoted sections of replies is a learned skill - and that it is a skill many people have trouble with for a number of legitimate reasons, none of which are the fault of either the person trying to decipher the email or the person who sent it, but simply a matter of experience and application.

If you look closely at email messages you will see that there are a number of different formats used to identify quoted content depending mostly on which email client was used to create the reply. Learning how these different formats interact takes time and patience which most people simply don't find worth the effort - especially in a forum where NOTHING posted here is really worth much effort.

I can usually (NOT always) track quoted material several levels deep, but I've been reading internet emails for more than three decades, and computer networked messages for several years before that -- plus I spent many years in government positions where understanding who said what in email messages was actually a job requirement. Without that background I wouldn't have the skills to untangle the hodgepodge of quotes that are common here.

If you look back to the email which you sent asking why something showed you as the author of a couple of lines you didn't write, you will see that the particular email you were talking about was one where your message included those lines as part of what you quoted from someone else. Then a third person quoted part of your message which included the original quote. Unless you are dealing with contracts, negotiations, or serious administrative matters is just isn't worth the effort of trying to keep track of quotes within quotes within quotes - especially when some of the people editing the quotes aren't interested in maintaining any sort of accountability.

This is a known issue. The exact cause hasn't been isolated yet. This radio I've seen has an older firmware version (N5R-219).

Until the problem is identified and patched, the OEM software will have to be used.

49061. 2 UV-5R questions (radio and charger)

Yahoo group: baofeng_uv5r (2015)
Date: 2015-03-08 20:38:53 UTC
From: baofengnoob@...
Topic: 49061 Message: 49061

After searching for close to a year, I finally got off my duff and decided to sign up here to ask these questions.

Radio question: I got my radio in February of last year. Followed the charging instructions and all that stuff. About a month into using it daily, the radio stopped recognizing a full battery (no matter the battery level, the icon n the screen only shows one bar). Is this a battery problem or a radio issue?

This ties into the next question: Right about the same time, the LED on the charger would be red when the charger is not in use, but would go out completely when in use. Testing the output shows 8.5v.

Now the LED on the charger won't light up at all, the output shows 8.5v, and the battery won't charge; no matter if it's connected to the radio or not.

Is there a fix besides replacing the entire unit?

What I did previously: Replaced the charger (same issue as above), replaced the battery (again, same result).

This sounds like a charger problem. This used to be a real common problem. Poor soldering, and in some cases no soldering was the issue. The charging cradle is easy to open up and examine. A lot of times the wires that connect the tabs that contact the battery to the circuit board have cold solder joints or not solder at all. These can be easily fixed with a soldering iron.

If you are not up to soldering, then you can purchase a replacement charger on eBay for about $5-$9 shipped.

(China) http://www.ebay.com/itm/BAOFENG-Brand-Radio-UV-5R-Original-Desktop-Charger-Base-suit-for-UV-5R-5RA-5R-/390870860868

(U.S.A.) http://www.ebay.com/itm/Original-Desktop-Charger-For-BAOFENG-UV-5R-UV-5R-UV-5RE-PLUS-US-SELLER-/271747526082

An even better solution is to purchase the TYT BCG-F8 charger. It fits the battery better than the OEM charger, appears to be made batter and as a bonus, will operate with 13.8 volts DC input (hook it up to your station power supply or use it in the care with a straight through cable (purchased separately)). It is available from 409shop for $12.50 shipped.

(China) http://www.409shop.com/409shop_product.php?id=106604

And it wouldn't hurt to have a spare battery. $8 shipped

(U.S.A) http://www.ebay.com/itm/Baofeng-Pofung-BL-5-1800mAh-7-4V-Stock-Li-ion-Battery-for-UV-5R-5RE-Radio-Black-/311307126268

49065. Defect or New Firmware Bug

Yahoo group: baofeng_uv5r (2015)
Date: 2015-03-09 02:07:39 UTC
From: cprendon@...
Topic: 49065 Message: 49065

I have a few BFF8+ radios running BFS313 firmware which have had no functional issues so I just bought another. This one is firmware N5R213. But something strange is happening with just the new one using the same programming and antennas as the others.

With the stock rubber duck it works fine. Put on a 15" higher gain antenna and I start losing receive on signals which are of medium and low strength. Medium signals are now very weak and what were weak ones are now gone. Just static. I opened the squelch to make sure. I connected my mobile antenna with 3 - 5 db gain and even the medium signals are now gone (just static). I can still TX and receive the reply on the other radios but NOAA and repeaters which were not really strong (maybe 7 and lower) are now just static (RX) Go back to the stock antenna and they are all back to normal. I have verified that is is not a connection problem. I have another radio right next to it to listen to the exact same signal.

The higher the antenna gain the weaker the medium to weak stations get in proportion. Strong stations are unaffected. I do not have this problem with any of these stations on the other radios, just the new one with the new firmware.

Has anyone heard of this being related to the latest firmware, or do I just have a bad unit?

As would be expected the antennas with higher gain improve reception on the good radios. It is like the higher gain overdrives something and overwhelms the signal.

John,
Yes,
A bigger antenna will work better but the HT' can have a poor design receiver so compare it to a better T.
I used to have an older ICOM with thumb wheels for tuning in the repeater frequency.
I pulled it out and it was a 58 telescope whip and I was at Dennys in eddystone,PA and worked the guys in Cream Ridge,NJ with 4 watts and close to 50 miles.
Dual band antennas have losses's and a 1/4 wave has no gain.
http://www.hamuniverse.com/htantennamod.html/

http://ham.stackexchange.com/questions/1532/what-is-the-theoretical-performance-of-a-2m-1-4-wave-ground-plane-antenna-when-u

If you want gain on both bands then look for a nice center coil loaded antenna but consider the strain on the HT's BNC connector
BOB AF2Q

As would be expected the antennas with higher gain improve reception on the good radios. It is like the higher gain overdrives something and overwhelms the signal.

So when they say "Latest version" they lied? Imagine that... :-)

I sent in for replacement. Will update. FYI I followed standard diagnostic procedures. (diagnosed Telecom network problems for IBM as career) Used export/import of same image as good radios so config is the same. Immediately ruled out any connection problems as that is what I first suspected. Swapped antennas side by side with known good radios of same model but older firmware, etc. It has something to do with signal from the higher gain antennas (-2 is higher than -3) even when gain is less than unity, as it is relative to stock antenna. I tried antennas of 4 different increments in gain and each one made things incrementally worse as gain went up. Confirmed presence of (missing on bad radio) good signal with good radio in exact same position.

I have the same problem with a 2 1/2 year old UV-5R and a 6 month old UV-82. The better the antenna the worse it receives weak signals. You can also touch or move your hand close to the stock antenna and it will make the receive cut out. I am close to several TV and FM stations and I think they might be overloading the receiver. It might also be Issue #1 in this article:
http://kc9hi.dyndns.org/uv5r/programming/UV-5R_tech_discussion_fixes.pdf

Both of mine have the "improved" RDA1846S/RDA5802N chipset. That could be why it doesn't happen to older units.

Uhmm from what he stated the problem was, overloading is not the problem. the "strong signals" are uneffected, meaning he still hears them nice and strong. it is the med to low that are lost with the better antennas

Correct. forgive my terminology as my background is wire line Telecom not wireless. It is as if the higher gain antennas create a higher background level but not a higher signal level. As background levels go up and signals do not, the signals start falling below the detection level as a good signal. I can open squelch on a known good signal (as I hear it on the same model next to it) but all I hear is static on the lower level signals. The closer repeaters/higher level signals are still fine. This is progressive as gain goes up. It is also band independent. No difference I can tell between bands.

Not sure what your response means, but in case I wasn't clear, detuning the antenna by grabbing it resulted in better S/N because the UV5R's receiver was being overloaded by a strong nearby signal. Occasionally the overloading signal would disappear & the radio would hear normally. My Alinco HTs & mobile radio are not affected - they receive fine in the exact same locations.

Sure smells like front end overload.. Sometimes with front end overload, there is also background noise on strong signals. But, there is no mention of this.

Here is a pointer to a tutorial that may help:

http://www.radio-electronics.com/info/rf-technology-design/receiver-overload/basics-tutorial.php

Maybe a silly question, but did you also reload all of the frequencies/memories you deleted when you reset the radio?

Probably not.

Without seeing the exact ad, I can't be 100% sure, but the ad probably said it was the latest version of the radio -- which would be true enough because the radios are all the same.

And, if I recall correctly, you said you ordered more than one radio and that the radios you received were different firmware numbers. This suggests that you ordered them from a seller under the Fulfilled By Amazon program. If the radios came under Fulfilled By Amazon, that means "seller" had nothing to do with the radios that were sent and may not have been the supplier of some or even any of the radios you received.

If you are talking about the v3.2.0.0 driver, that isn't exactly true.

The first time you run it, if you have a driver already installed, it uninstalls it. Once that is completed, you run it again and it will then install.

I wouldn't mess with any CD that comes with a programming cable. I would get the driver from miklor.com. It has been downloaded and successfully used by so many that it is fairly certain to be safe. Most CDs that come with a programming cable are not commercially made and who know what kinds of surprises may be lurking on the disc.

FYI.for the spec section on these new TERMN-8R and such radios.

The FCC ID for Part 90 is T4K-QZQX3318

Part 95a,95j is T4K-8RSERIES

If you do want to search for them at the FCC site you need the "-" in the Product Code.

It's for qty 20. Price is very reasonable - $29.67 each.

Assuming performance is the same or better than a 5R Plus.

I can't quite tell if this model's battery design is the same as the standard UV-5R, but I do question it's ability to be "waterproof". Splash resistant I would believe, but "waterproof"? Still, for $31.67 each per unit (including freight) it's not a bad price, assuming you need 20 of the same radio.

49101. Re: Defect or New Firmware Bug

Yahoo group: baofeng_uv5r (2015)
Date: 2015-03-11 02:25:33 UTC
From: cprendon@...
Topic: 49065 Message: 49101

OK I just got my replacement of the exact same model. It is the Beep Bug version N5R-20 which doesn't bother me as I will not turn beep off. No more problem related to antenna gain. However I use two frequencies which it will not receive even with squelch open, 162.55 (NOAA) and for some reason 147.165. Everything else worked fine.

I used the export/import to get the channels from an image I use and wanted to copy. Suspecting a possible problem with that process I manually entered all the channels from scratch and no change. The band range settings do not cut this off, so I do not have any idea why these are not received. I even did a factory reset. TX is fine on all 22 channels. Just the RX on two freqs. I am giving up on this model.

I did notice that the first unit may have been a defect return resent to me. The display had no protective sheet on it but this one did. Just maybe it was recycled.

---In baofeng_uv5r@yahoogroups.com, <cprendon@...> wrote :

I have a few BFF8+ radios running BFS313 firmware which have had no functional issues so I just bought another. This one is firmware N5R213. But something strange is happening with just the new one using the same programming and antennas as the others.

With the stock rubber duck it works fine. Put on a 15" higher gain antenna and I start losing receive on signals which are of medium and low strength. Medium signals are now very weak and what were weak ones are now gone. Just static. I opened the squelch to make sure. I connected my mobile antenna with 3 - 5 db gain and even the medium signals are now gone (just static). I can still TX and receive the reply on the other radios but NOAA and repeaters which were not really strong (maybe 7 and lower) are now just static (RX) Go back to the stock antenna and they are all back to normal. I have verified that is is not a connection problem. I have another radio right next to it to listen to the exact same signal.

The higher the antenna gain the weaker the medium to weak stations get in proportion. Strong stations are unaffected. I do not have this problem with any of these stations on the other radios, just the new one with the new firmware.

Has anyone heard of this being related to the latest firmware, or do I just have a bad unit?

Welcome to the Fulfillment By Amazon (FBA) world. It doesn't surprise me one bit that older inventory is now being shipped.

I'm sure you already know that simply copying an existing Chirp file and uploading it directly into the new radio can cause problems. Have you tried a re-set and then manually entering the frequency? If it receives NOAA then and not once programmed via software, then it would point to the software (or procedure) as the issue.

Hi
I purchased few of the X version and sold them (it's my business here) and I've never tested them against the toughness tests. However there's a drawback in the design. The display is not adjustable like the regular models which sometimes makes it almost unreadable (Especially in high sunlight)

I was told by one of the companies I deal with in China that it will only be carried by that company per contract, until the contract expires. So it looks like they will be the sole source of them.

Interesting addition to the uv5R and clones collection though.

Who uses them and have you had any issues?

Have seen many complaints on Amazon about them getting very hot (sometimes melting) if transmitting (though likely long winded conversations)....

Will be using one of my UV5Rs for APRS and would like to use the battery eliminator, think it will be fine for short bursts every min..?

Thank you
Jon

Unfortunately a lot of the junk ones say Baofeng on them. They are
built in empty battery shells that still have the original OEM
"Baofeng Li-Ion Battery" label.

I am using a daily build of CHIRP that prevents uploading a different firmware and wouldn't do that anyway. After I did the factory reset I manually programmed (using CHIRP just the two problem channels and still I heard only static while on another radio I could hear NOAA and the repeater on the other at the same time the RX light didn't even light on this one. Strange that it would have a problem with specific freqs only when they are in band. I use this same CHIRP on 4 other radios without a problem. If it happens like this again (I ordered a straight UV5R) I will manually program the problem freqs from the keypad to rule out everything computer related.

---In baofeng_uv5r@yahoogroups.com, <craig.n7lb@...> wrote :

Welcome to the Fulfillment By Amazon (FBA) world. It doesn't surprise me one bit that older inventory is now being shipped.

I'm sure you already know that simply copying an existing Chirp file and uploading it directly into the new radio can cause problems. Have you tried a re-set and then manually entering the frequency? If it receives NOAA then and not once programmed via software, then it would point to the software (or procedure) as the issue.

On Tue, Mar 10, 2015 at 7:25 PM, cprendon@... mailto:cprendon@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com mailto:baofeng_uv5r@yahoogroups.com> wrote:
OK I just got my replacement of the exact same model. It is the Beep Bug version N5R-20 which doesn't bother me as I will not turn beep off. No more problem related to antenna gain. However I use two frequencies which it will not receive even with squelch open, 162.55 (NOAA) and for some reason 147.165. Everything else worked fine.

I used the export/import to get the channels from an image I use and wanted to copy. Suspecting a possible problem with that process I manually entered all the channels from scratch and no change. The band range settings do not cut this off, so I do not have any idea why these are not received. I even did a factory reset. TX is fine on all 22 channels. Just the RX on two freqs. I am giving up on this model.

I did notice that the first unit may have been a defect return resent to me. The display had no protective sheet on it but this one did. Just maybe it was recycled.

---In baofeng_uv5r@yahoogroups.com mailto:baofeng_uv5r@yahoogroups.com, <cprendon@...> wrote :

I have a few BFF8+ radios running BFS313 firmware which have had no functional issues so I just bought another. This one is firmware N5R213. But something strange is happening with just the new one using the same programming and antennas as the others.

With the stock rubber duck it works fine. Put on a 15" higher gain antenna and I start losing receive on signals which are of medium and low strength. Medium signals are now very weak and what were weak ones are now gone. Just static. I opened the squelch to make sure. I connected my mobile antenna with 3 - 5 db gain and even the medium signals are now gone (just static). I can still TX and receive the reply on the other radios but NOAA and

repeaters which were not really strong (maybe 7 and lower) are now just static (RX) Go back to the stock antenna and they are all back to normal. I have verified that is is not a connection problem. I have another radio right next to it to listen to the exact same signal.

The higher the antenna gain the weaker the medium to weak stations get in proportion. Strong stations are unaffected. I do not have this problem with any of these stations on the other radios, just the new one with the new firmware.

Has anyone heard of this being related to the latest firmware, or do I just have a bad unit?

Ok, seems to be a reasonable sort of Omni.

It's 1.5:1 SWR, 17.5 forward power, 7.0 reverse power. This is with my mobile Kenwood 281A on low 25W out. Will me grounding it help? It has no ground.

More correctly it’s ‘DC Grounded’ but has radials so has its own ground plane – in short, probably not.

I can live with the SWR but would like to get more than 17.5 forward at 25.

1.5:1 is a perfectly acceptable SWR, as a rule of thumb, anything under 2:1 is considered to be alright for most purposes.

We need a little more information – for instance, what type of coax is it, how is it terminated and how long is the coax run?

Additionally, you are stating 17.5 (presumably watts) Forward Power v 7 watts of reverse (presumably reflected) power which appears excessive.

As I understand it, a VSWR of 1.5:1 would give reflected power of around 4% of transmitter output power, which based on 25w out of the TX would be more like 1w reflected power, so I’m not sure how you are coming up with 7w of reflected power at 25w out of the TX. If that’s the case, it would imply a VSWR of about 3.5:1 since reflected power at that ratio is about 30.9% of transmitted power – about 7.725w at 3.5:1 assuming 25w out of the TX.

Have a look at http://www.antenna-theory.com/definitions/vswr.php in particular the table about halfway down the page.

I think you may be trying to fix something that really isn’t broken and you need to remember that the transmission line is a major part of the equation, not just the antenna, but in this case, I think you have simply got the numbers wildly wrong somewhere...

.:(TYVM for any help. I can't find an Elmer.

Seem to be 1 or 200 on here. Hope this helps.

So, I was installing the latest Chirp Daily Build and I kept getting write errors when executing the installer. I downloaded it again. I entered the Admin password and the installer ran for just a second before erroring with a write error. I was ready to write the group and see if the current build had any known errors. I was starting to log off and change my user acct to Admin which I have found some software requires (an Admin popup signon isn't enough) and was closing down the programs currently running when I discovered that you cannot install Chirp when the current version is still running. DUH!!!

Please tell me someone has done something MORE stupid...

I give up! I got the UV5R and hooked it up to a known good genuine FTDI cable(and known good Chirp) and it would constantly fail to download. I pushed, pulled, twisted the connector and held my mouth funny and it always errored out. I tried it (cable/software) on 3 other UV5R type radios and it worked fine. It constantly said that the radio did not respond. The radio would reset every time I tried to download. I even tried a speaker/mic to check the connectors and it worked fine on both TX and RX and audio RX. I don't want one I have to keyboard program as I have multiple images I change often. I am done wiht a new UV5R for awhile. Amazon must think I an scamming them by now. I was lucky to got the first 4 that worked perfectly guess.

Thanks,,Thats true, although, with the stock antenna I can pull in a weather broadcast outside my area with the stock ant , with the 701 I couldn't hear anything and I looked for a hot spot… Now after I spent my money $15.99 I'm going to dig around to find if this a not genuine ant.

49129. Today I received my new TERMN-8R

Yahoo group: baofeng_uv5r (2015)
Date: 2015-03-13 02:18:39 UTC
From: wassim
Topic: 49129 Message: 49129

Hello All

For all of you who are interested, today I received the new aTERMN-8R radio from AnyTone purchased via Amazon.

Before I opened the box, I took some photos, which I will hope to upload to the agroup's library sometime soon.

The radio seems nice, almost the same size as the UV-5R, but the case us curvy so it is not a direct size equipment.

Having it for just a couple of hours, it seems that AnyTone has dome some improvements. For one the plastic the case is made of seems to be of a good quality. I do not have anything but the UV-5R to compare it to.

The battery is rated at 2200 mAh and it complements the curvature of the radio. The radio comes in a nice black and white and orange box. In it is a 104 page manual with the color cover printed printed on glossy paper. I sampled the PDF version on line and I found some edit mistakes. Nothing to drastic but yet not perfect ,-) on page 104 there is a paged titled AnyTone Tech's Letter to you. Hum!! What should I say about page 104. In my book what goes on in private between consenting adults that does not impact me and is lawful is fine with me. To each his or her owns. So page 104 as far as I'm concerned is not in its place. It baffles me the motive behind it and it has lessened my views about AnyTone. Sorry to say that but I have not happened before in any manual of any sort.

Any how let's continue with the radio stuff. It looks nice, the radio fi TS in my hand comfortably, and the antenna that came in the box seems to be a redesign of the Baofeng A-V85.

When I turned the radio on, it did not announce, but gave me a wel-come broken onto two lines. I am waiting for the battery to fully charge, then read the manual an in the morning program some frequencies and put it through the paces.

Any questions are welcomed, but just give me some time to get familiar with the radio.

Hi Anthony

I am not a Baofeng expert, but I do not think that the scan function is dependent on the number of frequencies you want to scan. Obviously if you only have one frequency you want to scan, well that is now called monitoring. But as soon as you add the 2nd frequency to scan then the radio should cycle between them looking for traffic. Again add more frequencies and the radio should cycle between them looking and listening for traffic.

I would suggest doing a factory reset, look at the web site for the menu options to do that, and then test to see if two frequencies do scan before you delete anything. If the same happens then you may need to look at what the radio is doing or not doing properly.

I hope a more seasoned member will chime in and teach us something new.

Hi there

I presume you are working on a Windows-based machine. If it Windows 7 or 8, you could right click on the task bar and activate the Task Manager. Sorry I do not have my computer in front of me so I am working from memory. In the Task Manager you can terminate any running program. Then you can restart the process again and hope it continues properly.

I was thinking you had a bad hard drive but when I reached the end of your message, I was happy it wasn't that bad.

Good job.

Thanks Jim

What my feelings are is that there are certain subjects that are best left for the individual to decide what direction to pursuit. From a religious stand point my belief system is mine and mine to deal with. Your thoughts are yours and yours to deal with. I do not want to impose my belief system on you or anyone else, and I sure would demand the same courtesy.

It's just funny and totally unexpected to see religious beliefs propagated via a technical manual. If it was an addendum in the box, it may have been OK, I suppose. It goes to this thing about yours and mine. Having it in the manual forces me to keep it so that I do not mutilate the document.

I may call on you to send me that package,, just because I am an open minded person. But then again it's my choice to ask or not ask for it.

****
Please for anyone reading this thread, LETS STAY ON TOPIC. If you want to debate page 104 START A NEW THREAD.

For all of you who are interested, today I received the new aTERMN-8R radio from AnyTone purchased via Amazon.

Any questions are welcomed, but just give me some time to get familiar with the radio.

Hi Xaun Loc

I have two photos, one on the outside of the box and one under the battery on the radio. Both have a serial number with a bar code and the following information:

FCC ID: T4K-QZQX3318; T4K-8SERIES.

The label also has a RF Power: 5W but I thought the radio was advertised as 6 watts! Go figure.

The label also has a RoHS compliant.

I'll upload these two particular photos after I white out the serial number and bar code ;-)

Hope this helps for now.

Hi Anthony
I am not a Baofeng expert, but I do not think that the scan function is dependent on the number of frequencies you want to scan. Obviously if you only have one frequency you want to scan, well that is now called monitoring. But as soon as you add the 2nd frequency to scan then the radio should cycle between them looking for traffic. Again add more frequencies and the radio should cycle between them looking and listening for traffic.
I would suggest doing a factory reset, look at the web site for the menu options to do that, and then test to see if two frequencies do scan before you delete anything. If the same happens then you may need to look at what the radio is doing or not doing properly.
I hope a more seasoned member will chime in and teach us something new.

I have 2. one from ebay the otber from BaofengTech on Amazon. it one from ebaybecomes to hot to hold after about 8 1-2min transmissions with same listen time between them. the circuts are inside the empty battery boc with the cigarette lighter end just being a passiveconnection. the one I revieved from BaofengTech has the ccircuits in the plug of the coard, not the batterybox, the batterybox is just a connection and it stays cool with same said cycles and beyond. I have yet to even feel even warming of the plug circuits even using it with my BF-F8HP in 8w mode.
You decide

Unfortunately a lot of the junk ones say Baofeng on them. They are

built in empty battery shells that still have the original OEM

"Baofeng Li-Ion Battery" label.

Uhmmm this is a baofeng Radio blog. I don't believe I need to see these, in my opinion, over priced radios from "Anytone" here too?

Thanks. I was wondering if they had waited until after the approval before packing them for shipment to Amazon. Apparently they did.

The second you do a factory "reset" you erase any memories that you had programmed, so if you immediately try to scan (without reprogramming your memories back into the radio) all you'll do is start scanning frequencies.

For the last almost 3 years it has worked like this...

It obviously requires 2 or more programmed memories in the "scan list" to be able to scan.

Only memories in the "scan list" are scanned. Only memories with the "scan_add" bit set are added to the "scan list". The "scan list" is only updated when the radio is powered on or rebooted.

All manually programmed memories have the "scan_add" bit set. The "scan_add" bit can only be edited using software.

So all manually programmed memories will be scanned once they are added to the "scan list" by powering on or rebooting the radio.

That was then...

Recently, I've seen a new radio immediately add a new, manually programmed memory to the "scan list". It may be there are some firmware versions out there that do not follow the above. Since BFS313, Baofeng has been making changes that "break" things quite regularly.

What I would do if I had one of these radios would be to program a few memories using the keypad and then download the radio into the OEM or CHIRP software to see if these newly added memories have the "scan_add" bit set or not.

Correct me if I'm wrong, but when an antenna is "tuned" to make it higher gain in certain bands. (i.e. 144-150), doesn't it decrease the efficiency all the way around for freqs outside that "tune". I have a 771 and a 701. I find that the stock antennas pull in the weather and FM stations quite well, but are average on the actual 2m ham bands. My 701 seems to work a LOT better in the ham bands, but is crap for the weather channels.

Tery distant repeaters, or even better have a buddy do a simplex distance test.
